EXECUTIVE SUMMARY

INTRODUCTION

The Eastern San Joaquin Groundwater Subbasin (Eastern San Joaquin Subbasin, or Subbasin) is governed by the *Eastern San Joaquin Groundwater Subbasin Groundwater Sustainability Plan* (GSP) (2019), which the Department of Water Resources (DWR) found adequate in 2022 and was developed to comply with the Sustainable Groundwater Management Act (SGMA) of 2014 and the GSP Emergency Regulations.

The GSP was developed and approved by the Eastern San Joaquin Groundwater Authority (ESJGWA) and each of its member agencies. The ESJGWA is a joint powers authority of 16 groundwater sustainability agencies (GSAs) within the Eastern San Joaquin Subbasin: Central Delta Water Agency (CDWA), Central San Joaquin Water Conservation District (CSJWCD), City of Lodi, City of Manteca, City of Stockton, Eastside San Joaquin GSA (Eastside GSA) (composed of Calaveras County, Calaveras County Water District [CCWD], Stanislaus County, and Rock Creek Water District), Linden County Water District (LCWD), Lockeford Community Services District (LCSD), North San Joaquin GSAs (-Eastern San Joaquin 1 and -Eastern San Joaquin 2), South Delta Water Agency (SDWA), South San Joaquin GSA (composed of South San Joaquin Irrigation District [SSJID], City of Ripon, and City of Escalon), Stockton East Water District (SEWD), and Woodbridge Irrigation District (WID). Collectively, these 16 GSAs will be referred to as "GSAs."

This water year (WY) 2023 Annual Report for the Eastern San Joaquin Subbasin has been prepared in compliance with Article 7 *Annual Reports and Periodic Evaluations by the Agency*, § 356.2 *Annual Reports* of the GSP Emergency Regulations, as included in the California Code of Regulations and DWR's *A Guide to Annual Reports, Periodic Evaluations, & Plan Amendments* (CA DWR, 2023). WY 2023 covers the period from October 1, 2022 through September 30, 2023.

GROUNDWATER MANAGEMENT ACTIVITIES AND MILESTONES

The GSP sets sustainable management criteria for applicable sustainability indicators and identifies projects and management actions to aid in maintaining sustainable conditions throughout the Eastern San Joaquin Subbasin. Under SGMA, sustainable management criteria can be defined as the following:

- **Minimum Threshold** Quantitative threshold for each sustainability indicator used to define the point at which undesirable results may begin to occur.
- **Measurable Objective** Quantitative target that establishes a point above the minimum threshold that allows for a range of active management in order to prevent undesirable results.
- Interim Milestones Targets set in increments of five (5) years over the implementation period of the GSP to put the basin on a path to achieving sustainability by 2040.

• **Margin of Operational Flexibility** – The range of active management between the measurable objective and the minimum threshold.

During WY 2023, monitoring relative to all sustainability indicators indicated the Eastern San Joaquin Subbasin was continuing to operate under sustainable conditions relative to their respective sustainability indicators and established sustainable management criteria in the GSP. The GSAs continued to implement projects identified in the GSP, as summarized in Appendix A. Notable projects that advanced in WY 2023 include:

- Additional groundwater monitoring wells and programs in NSJWCD
- Completion of Phase II of the NSJWCD South System improvement project
- Addition and operation of the NSJWCD Tecklenberg, Miller, and Reynolds Recharge projects
- Approval of a contract to begin installation for the City of Stockton Advanced Metering Infrastructure project
- South System Groundwater Banking project, with East Bay Municipal Utilities District (EBMUD), began its pilot banking project
- SSJID completed and adopted a Water Master Plan in December 2022 to evaluate system improvements
- City of Manteca adopted a Reclaimed Water Facilities Master Plan in January 2023 for the Manteca Golf Course project

GROUNDWATER MONITORING AND CONDITIONS ASSESSMENT

Hydrologic Conditions

WY 2023 was wetter than average and classified as a wet water year according to the San Joaquin River Valley Water Year Hydrologic Index. Estimated precipitation during WY 2023 was approximately 182% of the long-term (1969-2022) Subbasin average. Measured stream flows in the San Joaquin River were approximately 99 percent of long-term averages, whereas those in the Calaveras River were 242 percent of long-term averages and those in the Cosumnes River were 265 percent of long-term averages.

Groundwater Levels

Groundwater elevations generally increased throughout WY 2023 for almost all wells in the representative monitoring network with groundwater level data available. No wells reported groundwater levels below the minimum thresholds established in the GSP. Out of 21 wells in the representative monitoring network for groundwater levels, six (6) wells reported Fall 2022 measurements and 9 wells reported Spring 2023 measurements that met or exceeded their

measurable objective. All recent data show typical patterns of annual highs in the Spring and lows in the late Summer or Fall that match historical trends.

Groundwater Storage

The groundwater storage sustainability indicator for the Eastern San Joaquin Subbasin uses the groundwater level sustainable management criteria (i.e., Minimum Threshold, Measurable Objective, Interim Milestones, and Margin of Operational Flexibility) as a proxy. Therefore, the minimum thresholds for groundwater levels are designed to be protective of significant and unreasonable impacts to changes in groundwater storage. For WY 2023, groundwater storage was estimated using the ESJWRM (the Subbasin's integrated groundwater-surface water model). Based on these estimates, from the beginning to the end of WY 2023, storage in the Eastern San Joaquin Subbasin increased by approximately 69,500 AF. This volume represents about 0.1% of the total fresh groundwater storage, which was estimated to be more than 50 million acrefeet (MAF) in 2015. This increase in storage during WY 2023 follows a decrease in total storage during WY 2022 (which was a critical water year).

Groundwater Quality

Salinity is the only water quality constituent for which minimum thresholds were established in the Eastern San Joaquin Subbasin. In WY 2023, five of the representative monitoring wells reported measurements for total dissolved solids (TDS). TDS was not reported at the remaining five wells due to a variety of reasons, including inactive wells due to water quality concerns. All measurements reported are above the minimum thresholds for water quality set in the GSP.

Saltwater Migration

The Eastern San Joaquin Subbasin is not in a coastal area, and seawater intrusion via the aquifer formations is unlikely. Seawater could migrate into the Sacramento-San Joaquin River Delta (Delta) via the tides or as result of sea level rise and climate change. This could create the potential for seawater to percolate into the aquifers. This condition would be observable and widely noted with current monitoring of surface water conditions in the Delta.

There is saline water underlying the Delta in deeper aquifers, and saline conditions have been observed in shallower zones. This potential impairment to beneficial uses of groundwater would be related to the migration of the saline waters from west to east into the Eastern San Joaquin Groundwater Subbasin due to hydraulic conditions and the lowering of groundwater levels. The GSP established monitoring protocols for the early detection of saltwater migration from the west, under the Delta, to the east into the Eastern San Joaquin Groundwater Subbasin. The monitoring program is intended to identify the issue associated with saltwater migrations so that the ESJGWA can take early action to address undesirable results. In WY 2023, chloride was measured at five of the ten representative monitoring wells. Those not monitored reported a variety of reasons, including inactive wells due to water quality concerns. All measurements reported were above the minimum threshold for chloride concentrations set in the GSP.

Land Subsidence

The land subsidence sustainability indicator in the Eastern San Joaquin Subbasin uses the groundwater level sustainable management criteria as a proxy. The minimum thresholds for groundwater levels are designed to be protective of significant and unreasonable impacts to land subsidence. There were no minimum threshold exceedances for groundwater levels; therefore, there were no land subsidence sustainability threshold exceedances. Land subsidence has not historically been an area of concern in the Subbasin and there are no records of significant land subsidence caused by groundwater pumping in the Subbasin. Section 2.1.5 of the GSP details the extent of clay deposits in the Subbasin, and Section 2.2.5 of the GSP includes a description of the minimal subsidence that has historically occurred in the Subbasin. Additionally, Continuous GPS subsidence monitoring stations in the Subbasin and InSAR data released by DWR show no greater than 0.2 feet of land subsidence occurred in the Eastern San Joaquin Subbasin.

Groundwater-Surface Water Interaction

The depletions of interconnected surface water sustainability indicator in the Eastern San Joaquin Subbasin uses the groundwater level sustainable management criteria as a proxy. The minimum thresholds for groundwater levels are designed to be protective of significant and unreasonable impacts to depletions of interconnected surface waters. There were no minimum threshold exceedances for groundwater levels; therefore, there were no interconnected surface water sustainability threshold exceedances.

Total Water Use

The primary water use sectors in the Eastern San Joaquin Subbasin include urban and agriculture uses, with groundwater supplying the majority of the total water use. During WY 2023, groundwater extraction and use is estimated to be 805,994 AF for the Eastern San Joaquin Subbasin.

Surface water deliveries during WY 2023 are estimated to be 553,840 AF with the majority of surface water used between May and September. In WY 2023, Eastside Division contractors for irrigation water services were allocated 100% of their Central Valley Project (CVP) contract total with the United States Bureau of Reclamation (USBR). SEWD and CSJWCD are the only CVP contractors in the Eastern San Joaquin Subbasin.

Total water use is the sum of the groundwater use and surface water use; therefore, total water use during WY 2023 is estimated to be 1,359,834 AF.

ANNUAL REPORT ELEMENTS

The following table presents the sections and page numbers where requirements for Annual Report elements can be found, subject to Article 7 §356.2 of the GSP Regulation Sections in the California Code of Regulations.

California Code of Regulations - GSP Regulation Sections	Annual Report Elements	Section(s) and page numbers(s) where requirements for Annual Report elements are included
Article 7	Annual Reports and Periodic Evaluations by Agency	
§ 356.2	Annual Reports	1
	Each Agency shall submit an annual report to the Department by April 1 of each year following the adoption of the Plan. The annual report shall include the following components for the preceding water year:	
	(a) General information, including an executive summary and a location map depicting the basin covered by the report.	Executive Summary, Figure 1 pg. 7:10, 16
	(b) A detailed description and graphical representation of the following conditions of the basin managed in the Plan:	
	(1) Groundwater elevation data from monitoring wells identified in the monitoring network shall be analyzed and displayed as follows:	
	(A) Groundwater elevation contour maps for each principal aquifer in the basin illustrating, at a minimum, the seasonal high and seasonal low groundwater conditions.	Section 3.2, Figure 3, Figure 4 pg. 31:35
	(B) Hydrographs of groundwater elevations and water year type using historical data to the greatest extent available, including from January 1, 2015, to current reporting year.	Section 3.2, Figure 2, Appendix B, Appendix C pg. 31:35, 87:133
	(2) Groundwater extraction for the preceding water year. Data shall be collected using the best available measurement methods and shall be presented in a table that summarizes groundwater extractions by water use sector and identifies the method of measurement (direct or estimate) and accuracy of measurements, and a map that illustrates the general location and volume of groundwater extractions.	Section 3.8.1, Figure 11, Table 3 pg. 45:46, 48:49
	 (3) Surface water supply used or available for use, for groundwater recharge or in-lieu use shall be reported based on quantitative data that describes the annual volume and sources for the preceding water year. 	Section 3.8.2, Table 4 pg. 46, 50

California Code of Regulations - GSP Regulation Sections	Annual Report Elements	Section(s) and page numbers(s) where requirements for Annual Report elements are included
	(4) Total water use shall be collected using the best available measurement methods and shall be reported in a table that summarizes total water use by water use sector, water source type, and identifies the method of measurement (direct or estimate) and accuracy of measurements. Existing water use data from the most recent Urban Water Management Plans or Agricultural Water Management Plans within the basin may be used, as long as the data are reported by water year.	Section 3.8, Table 5 pg. 45:55
	(5) Change in groundwater in storage shall include the following:	
	(A) Change in groundwater in storage maps for each principal aquifer in the basin.	Section 3.3, Figure 8 pg. 36:40
	(B) A graph depicting water year type, groundwater use, the annual change in groundwater in storage, and the cumulative change in groundwater in storage for the basin based on historical data to the greatest extent available, including from January 1, 2015, to the current reporting year.	Section 3.3, Figure 5, Figure 6, Figure 7 pg. 36:40
	(c) A description of progress towards implementing the Plan, including achieving interim milestones, and implementation of projects or management actions since the previous annual report.	Section 4, Appendix A pg. 56:67, 70:86

This page left blank intentionally.

1. INTRODUCTION

The Eastern San Joaquin Groundwater Subbasin (Eastern San Joaquin Subbasin or Subbasin) (**Figure 1**) has been identified by the California Department of Water Resources (DWR) as critically overdrafted. The Eastern San Joaquin Groundwater Sustainability Plan (Eastern San Joaquin GSP, GSP, or the Plan) was developed and submitted to DWR to meet SGMA regulatory requirements by the January 31, 2020, deadline for critically-overdrafted basins while reflecting local needs and preserving local control over water resources. While the Eastern San Joaquin GSP offers a new and significant approach to groundwater resource protection, it was developed within an existing framework of comprehensive planning efforts. Throughout the region, several separate yet related planning efforts have occurred previously or are concurrently proceeding, including integrated regional water management, urban water management, agricultural water management, watershed management, habitat conservation, and general planning and most closely, the *Eastern San Joaquin Groundwater Basin Groundwater Management Plan* (GMP) (2004). The Eastern San Joaquin GSP fits in with these prior planning efforts, building on existing local management and basin characterization.

The Eastern San Joaquin GSP provides a path to achieve and document sustainable groundwater management within 20 years following Plan adoption, promoting the long-term sustainability of locally-managed groundwater resources now and into the future.

The GSP was developed jointly by the Eastern San Joaquin Groundwater Authority (ESJGWA), which is a joint powers authority formed by the following 16 groundwater sustainability agencies (GSAs) within the Eastern San Joaquin Subbasin. Collectively, these 16 GSAs will be referred to as "GSAs".

- Central Delta Water Agency (CDWA)
- Central San Joaquin Water Conservation District (CSJWCD)
- City of Lodi
- City of Manteca
- City of Stockton
- Eastside San Joaquin GSA (Eastside GSA) (composed of Calaveras County, Calaveras County Water District [CCWD], Stanislaus County, and Rock Creek Water District)
- Linden County Water District (LCWD)
- Lockeford Community Services District (LCSD)
- North San Joaquin Water Conservation District (NSJWCD)
- Oakdale Irrigation District (OID)
- County of San Joaquin GSA Eastern San Joaquin 1

- County of San Joaquin GSA Eastern San Joaquin 2
- South Delta Water Agency (SDWA)
- South San Joaquin GSA (composed of South San Joaquin Irrigation District [SSJID] including all conveyance works, Woodward Reservoir, City of Ripon, and City of Escalon)
- Stockton East Water District (SEWD)
- Woodbridge Irrigation District (WID)

During water year (WY) 2023 (October 1, 2022, through September 30, 2023), groundwater management within the Eastern San Joaquin Subbasin evolved through the implementation of the GSP, which was ultimately adopted by the GSAs between November 2019 and January 2020. The GSP was developed in a stakeholder-driven environment, including 69 open meetings and numerous other outreach activities. The result is a GSP that describes groundwater conditions in the Eastern San Joaquin Subbasin and sets up a system of management based on quantitative thresholds, termed sustainable management criteria (SMC), for six sustainability indicators: chronic lowering of groundwater levels, degraded water quality, saltwater migration, inelastic land subsidence, change in groundwater storage, and depletions of interconnected surface water.

This Annual Report provides information on conditions in the Eastern San Joaquin Subbasin and progress towards implementing the GSP for WY 2023. The report has been prepared in accordance with Article 7 *Annual Reports and Periodic Evaluations by the Agency*, § 356.2 *Annual Reports* of the GSP Emergency Regulations as contained within the California Code of Regulations. Updated guidance included in DWR's *A Guide to Annual Reports, Periodic Evaluations, & Plan Amendments* was also considered in the creation of this report (CA DWR, 2023).

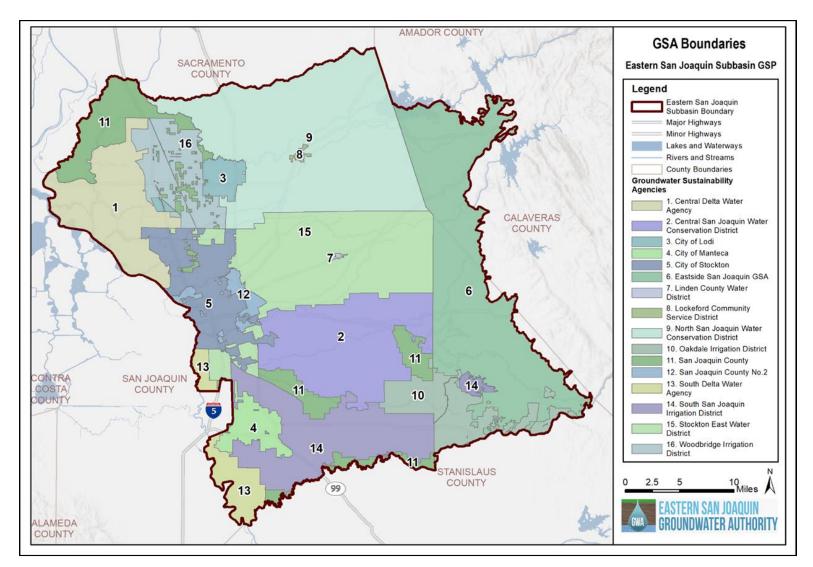

Figure 1. Eastern San Joaquin Groundwater Subbasin

This page left blank intentionally.

2. GROUNDWATER MANAGEMENT ACTIVITIES AND MILESTONES

This section documents the activities and milestones from the passing of the Sustainable Groundwater Management Act (SGMA) throughout GSP development, summarizes the contents of the GSP for the Eastern San Joaquin Subbasin, and documents GSP implementation progress during WY 2023.

Implementation of the GSP is underway, which includes this Annual Report as well as monitoring and associated assessment of sustainable management criteria and identified projects, management actions, and adaptive management (as needed).

2.1 GROUNDWATER SUSTAINABILITY PLAN DEVELOPMENT

Preliminary development of the Eastern San Joaquin GSP began with formation of the member GSAs and agreement to form the ESJGWA for the purpose of GSP development and implementation. The ESJGWA Board of Directors (ESJGWA Board) developed an Advisory Committee (AC) that included staff members from the GSAs. The AC provides technical review and recommendations to the ESJGWA Board for ongoing sustainable groundwater management and development of the Eastern San Joaquin GSP. The ESJGWA also developed a Groundwater Sustainability Workgroup (Workgroup) to promote stakeholder input and relied upon the Workgroup when developing the GSP. The Workgroup began with an application process to ensure a diverse cross-section of populations were represented to serve on the Workgroup. Workgroup members participated and provided valuable input throughout the GSP development process.

On March 3, 2018, the GSAs filed a notice of intent to prepare a GSP with DWR. A public draft of the GSP was posted for public comment in July 2019, and a notice of intent to adopt a GSP was sent by the ESJGWA to all cities and counties in the Eastern San Joaquin Subbasin on August 16, 2019. The Final GSP, published November 5, 2019, was adopted by the individual GSAs between November 2019 and January 2020. On January 8, 2020, the ESJGWA Board passed a resolution agreeing to submit the Plan to DWR on behalf of the 16 GSAs.

The ESJGWA received comments on the submitted GSP from DWR in April 2022. A Revised GSP was again adopted by the individual GSAs and re-published in June 2022 with revisions to address DWR's comments incorporated. Development of the required 5-Year Periodic Evaluation and GSP Amendment is currently underway, ahead of the 2025 due date.

2.2 GROUNDWATER SUSTAINABILITY PLAN CONTENTS SUMMARY

The GSP was prepared in compliance with all relevant elements of the SGMA Regulations and GSP Emergency Regulations, Article 5 *Plan Contents*. The subsections below summarize the contents of the GSP relevant to assessing changing conditions in the Eastern San Joaquin Subbasin for the purposes of evaluating GSP implementation progress in this Annual Report.

2.2.1 Plan Area

The GSP's plan area encompasses the Eastern San Joaquin Subbasin (5-22.01), as defined by DWR's Final 2018 Basin Boundary Modifications (released February 11, 2019). The Eastern Subbasin is located at the north end of the larger San Joaquin Valley Groundwater Basin, to the east of the Sacramento-San Joaquin River Delta (Delta), and is generally bounded by the Sierra Nevada foothills to the east, the San Joaquin River to the west, Dry Creek to the north, and Stanislaus River to the south. The major river systems traversing the Subbasin include the Calaveras, Mokelumne, and Stanislaus Rivers. Multiple smaller streams also flow through the Subbasin to the San Joaquin River.

The plan area covers areas of San Joaquin County east of the San Joaquin River, including the cities of Stockton, Lodi, Manteca, Escalon, and Ripon, and portions of Calaveras and Stanislaus Counties. The Subbasin is bordered by Sacramento, Amador, and Contra Costa Counties. Land use patterns in the Eastern San Joaquin Subbasin are dominated by agricultural uses, including nut and fruit trees, vineyards, row crops, grazing, and forage. Irrigated crop acreage in the Subbasin is 44% fruit and nut trees, 23% vineyards, and 8% alfalfa and irrigated pasture, according to 2018 DWR statewide crop mapping (LandIQ, 2022).

2.2.2 Hydrogeologic Conceptual Model

One principal aquifer exists across the Eastern San Joaquin Subbasin that is composed of three water production zones. The zones are:

- **Shallow Zone** that consists of the alluvial sands and gravels of the Modesto, Riverbank, and Upper Turlock Lake Formations
- Intermediate Zone that consists of the Lower Turlock Lake and Laguna Formations
- **Deep Zone** that consists of the consolidated sands and gravels of the Mehrten Formation

The Stockton Fault is the largest fault in the Eastern San Joaquin Subbasin. It is a large reverse fault with displacements of up to 3,600 feet. The Vernalis Fault is a reverse fault with a northwest-southeast trend that bounds the Tracy-Vernalis anticlinal trend that is mapped outside of the west boundary of the Eastern San Joaquin Subbasin. Additionally, the Stockton Arch is a broad transverse structure that underlies the southern half of the Eastern San Joaquin Subbasin. The base of fresh water (encountered saline) has been observed as shallow as 650 feet below ground surface (bgs) in the eastern part of the Subbasin to over 2,000 feet bgs in the northern part of the Subbasin.

2.2.3 Existing Groundwater Conditions

Groundwater levels in some portions of the Subbasin have been declining for many years, while groundwater levels in other areas of the Subbasin have remained stable or increased in recent

years. The change in groundwater levels varies across the Subbasin, with the greatest declines occurring in the central portion of the Subbasin. The western and southern portions of the Subbasin have experienced less change in groundwater levels, in part due to the minimal groundwater pumping in the Delta area to the west and the import of surface water for agricultural and urban uses.

In many areas of the Subbasin, groundwater levels reached their lowest in Fall 1992. In numerous cases, areas that experienced undesirable results in 1992 put mitigation measures in place thereafter, often deepening wells, meaning that 1992 groundwater levels would no longer trigger undesirable effects. Groundwater levels in some areas of the Subbasin have recovered since 1992; however, groundwater levels in other portions of the Subbasin declined further below 1992 levels.

A central pumping depression exists east of the City of Stockton. Groundwater generally flows from the outer edges of the Subbasin towards the depression in the middle of the Subbasin. Along the eastern side of the Subbasin, the lateral gradient of groundwater levels ranges from approximately 21 feet per mile (ft/mi) during the seasonal high to 16 ft/mi during the seasonal low. Along the western side of the Subbasin, the lateral gradient ranges from approximately 7 ft/mi during the seasonal high to 6 ft/mi during the seasonal low. The steeper gradients on the east side of the Subbasin compared to the west side is primarly due to the steeper aquifer units in that area, combined with a lack of head influence from the Delta.

Groundwater quality in the Subbasin varies by location. Areas along the western margin have historically had higher levels of salinity. Salinity may be naturally occurring or the result of human activity. Sources of salinity in the Subbasin include Delta sediments, deep saline groundwater, and irrigation return water. Elevated concentrations of other constituents, such as nitrate, arsenic, and point-source contaminants, are generally localized and not widespread and are generally related to natural sources or land use activities.

While the total volume of groundwater in storage in the Subbasin has declined over time, groundwater storage reduction has not historically been an area of concern in the Subbasin as there are large volumes of fresh water stored in the aquifer. As estimated in the GSP, the total volume of fresh groundwater in storage was estimated at over 53 million acre-feet (MAF) in 2015 (Woodard & Curran, 2019, page 2-80). Significant impacts to groundwater beneficial uses were estimated (via modeling) to occur if there was a depletion of 23 MAF (e.g., only 30 MAF of fresh groundwater remained in the aquifer). As such, it is highly unlikely the Subbasin will experience conditions under which the volume of stored groundwater poses a concern, although the depth to access that groundwater does pose a concern.

Land subsidence has not historically been an area of concern in the Subbasin, and there are no records of land subsidence caused by groundwater pumping in the Subbasin. The three Continuous GPS subsidence monitoring stations in the Subbasin and DWR's InSAR data all indicated less than 0.2 feet in subsidence during WY 2023, further supporting the conclusion

that inelastic land subsidence is not currently an area of concern in the Subbasin. However, to be protective of future changes in land subsidence, these SMC are being re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment.

Seawater intrusion is not present in the Subbasin. While the Delta ecosystem evolved with a natural salinity cycle that brought brackish tidal water in from the San Francisco Bay, current management practices endeavor to maintain freshwater flows through a combination of hydraulic and physical barriers and alterations to existing channels.

Major river systems in the Subbasin are highly managed to meet instream flow requirements for fisheries, water quality standards, and the water rights of users downstream. Many smaller streams run through the Subbasin that provide contributions to both groundwater, riparian habitat, and the major river systems. The interconnection between reaches of these streams and the groundwater system will be better understood through monitoring as the GSP is implemented.

2.2.4 Water Budgets

Water budgets provide a quantitative accounting of precipitation, surface water and groundwater entering and leaving the Eastern San Joaquin Subbasin under historical, current, projected, and projected with climate change conditions. The budgets were estimated using the ESJWRM. The primary components of the groundwater budget are:

- Inflows:
 - Deep percolation from precipitation, applied water (surface water and groundwater) for agricultural lands, and applied water (surface water and groundwater) for outdoor use in the urban areas or industrial purposes
 - Stream seepage (i.e., losses to the groundwater system)
 - Other recharge (including unlined canals/reservoir seepage, local tributaries seepage, and Managed Aquifer Recharge [MAR] projects)
 - Subsurface inflow
- Outflows:
 - Groundwater outflow to streams (i.e., stream gain from the groundwater system)
 - Groundwater pumping
 - Subsurface outflow
- Change in Groundwater Storage (Inflows Minus Outflows)

The average annual groundwater storage is shown as decreasing under historical, current, projected, and projected with climate change conditions, suggesting conditions of overdraft without the implementation of projects and/or management actions to address this situation.

The sustainable conditions scenario results in groundwater outflows almost equal to groundwater inflows, bringing the long-term (50-year) average change in groundwater storage to close to zero. Based on this analysis, the sustainable yield of the Subbasin is about 715,000

acre-feet per year (AFY) \pm 10 percent. Groundwater pumping and sustainable yield is discussed further in Section 3.8.1. This sustainable yield estimate will be re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment effort.

2.2.5 Sustainable Management Criteria

SGMA allows several pathways to meet the distinct local needs of each groundwater basin, including development of sustainable management criteria, usage of other sustainability indicators as a proxy, and identification of indicators as not being applicable to the basin. Sustainable management criteria were developed based on information about the Subbasin in the hydrogeologic conceptual model, the descriptions of current and historical groundwater conditions, the water budgets (historical and projected), and input from stakeholders during the GSP development process.

The sustainability goal for the Eastern San Joaquin Subbasins is:

...to maintain an economically viable groundwater resource for the beneficial use of the people of the Eastern San Joaquin Subbasin by operating the Subbasin within its sustainable yield or by modification of existing management to address future conditions. This goal will be achieved through the implementation of a mix of supply and demand type projects consistent with the GSP implementation plan.

The method prescribed by SGMA to measure undesirable results and achieve the sustainability goal involves setting minimum thresholds and measurable objectives for a series of representative monitoring sites. These representative sites are a subset of the monitoring network developed as part of the GSP. The sustainable management criteria for the Subbasin are summarized in **Table 2**.

Of the six sustainability indicators addressed in the Eastern San Joaquin Subbasin, chronic lowering of groundwater levels is the driver for sustainable groundwater management as several other indicators all correlated with groundwater levels. Measurable objectives, minimum thresholds, and interim milestones were developed for each of the identified representative wells.

Minimum thresholds for groundwater levels were developed with reference to historical drought low conditions and domestic well depths. Specifically, minimum thresholds were established based on the deeper of the historical drought low plus a buffer of the historical fluctuation or the 10th percentile domestic well depth, whichever is shallower – establishing levels that are protective of 90 percent of domestic wells. In municipalities with ordinances requiring the use of municipal water (water provided by a city's municipal wells) for domestic users, the 10th percentile municipal well depth is used in place of the 10th percentile domestic well depth criteria. Measurable objectives were established based on the historical drought low and provide a buffer above the minimum threshold. A table summarizing minimum thresholds and measurable objectives is included in the GSP. Graphs showing the minimum threshold and measurable objective for each of the representative wells are contained in an appendix to the GSP and included herein as **Appendix B**. These SMC are being re-evaluated as part of the 2025 Period Evaluation and Plan Amendment in response to Corrective Actions advised by DWR.

Minimum thresholds for water quality were defined by considering two primary beneficial uses at risk of undesirable results related to salinity: drinking water and agriculture uses. Minimum thresholds are 1,000 milligrams per liter (mg/L) for each representative monitoring well, consistent with the upper limit secondary maximum contaminant level (SMCL) for total dissolved solids (TDS). Crop tolerances in the Subbasin range by crop type from 900 mg/L TDS for almonds up to 4,000 mg/L TDS for wheat, assuming a 90 percent yield. These SMC are being re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment in response to Corrective Actions advised by DWR.

The Eastern San Joaquin Subbasin is not in a coastal area, and seawater intrusion is not currently present. Undesirable results related to seawater intrusion are not currently occurring and are not reasonably expected to occur. However, this GSP recognizes that saltwater currently found in some of the aquifers under the Delta could migrate and impair groundwater quality. As such, the GSP establishes monitoring protocols for the early detection of saltwater migration from under the Delta or deep aquifer zones, were it ever to occur, so that the ESJGWA can take early actions to address any associated undesirable results.

The GSP develops minimum thresholds and measurable objectives that include monitoring for chloride and an analysis of isotopic ratios to identify the source of high salinity. The minimum threshold for saltwater migration is a 2,000 mg/L chloride isocontour line established near the western edge of the Subbasin between sentinel monitoring locations. A 2,000 mg/L chloride concentration is approximately 10 percent of seawater chloride concentrations (19,500 mg/L). These SMC are being re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment in response to Corrective Actions advised by DWR.

For depletions of interconnected surface water, the minimum thresholds and measurable objectives for groundwater levels are used. There is significant correlation between groundwater levels and interconnected stream depletions, and the groundwater levels minimum thresholds are found to be protective of depletions. Similarly, the minimum thresholds and measurable objectives for groundwater levels are used for the land subsidence and groundwater storage sustainability indicators as both are also strongly linked to groundwater levels. The groundwater levels minimum thresholds are found to be protective of land subsidence and groundwater storage. However, these SMC are being re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment in response to Corrective Actions advised by DWR.

2.2.6 Monitoring Networks:

Monitoring networks were developed for the sustainability indicators that apply to the Eastern San Joaquin Subbasin, leveraging existing monitoring that has been developed locally and in cooperation with DWR. The objective of these monitoring networks is to monitor conditions across the Subbasin so that the GSAs can continue to manage groundwater sustainably. Specifically, the monitoring network was developed to do the following:

- Monitor impacts to the beneficial uses or users of groundwater.
- Monitor changes in groundwater conditions relative to measurable objectives and minimum thresholds.
- Demonstrate progress toward achieving measurable objectives described in the GSP.
- Support estimation of annual changes in water budget components.

To achieve these objectives, the monitoring well networks incorporate sites and frequencies that can detect seasonal and long-term trends for each applicable sustainability indicator. This includes selection of an appropriate temporal frequency and spatial density to evaluate groundwater conditions related to the effectiveness of the GSP.

There are four monitoring well networks established within the Eastern San Joaquin Subbasin GSP: a representative network for water levels, a broad network for water levels, a representative network for water quality. Monitoring well data from the representative networks are used to determine compliance with the minimum thresholds, while data from the broad networks are used for informational purposes to identify trends and fill data gaps. The two monitoring well networks for water quality are also used to develop a chloride isocontour to evaluate potential for saltwater migration. Water level data inform depletions of interconnected surface water.

Wells in the monitoring networks are measured on a semi-annual schedule (spring and fall) for both groundwater levels and water quality. Historical measurements have been entered into the Subbasin Data Management System (DMS), and future data will also be stored in the DMS.

A summary of the wells in the monitoring networks is shown in **Table 1** below.

Representative Networks	Well Count
Groundwater Level	21 ¹
Groundwater Quality*	10
Broad Networks	
CASGEM (Groundwater Levels)	76
Nested or Clustered Wells (Groundwater Levels & Quality)**	16
Agency Wells (Groundwater Levels & Quality)**	5

Table 1. Summary of Monitoring Network Wells

*The 10 groundwater quality wells in the Representative Network are also part of the Broad Network for groundwater levels. The well count presented in this table for the Broad Network does not include the 10 wells that are included in the Representative Network for water quality.

**Wells are in both the groundwater level and water quality Broad Monitoring Network.

2.2.7 **Projects and Management Actions**

Achieving sustainability in the Subbasin requires implementation of projects and management actions. The Subbasin will achieve sustainability by implementing water supply projects that either replace groundwater use or supplement groundwater supplies to attain the current estimated pumping offset and/or recharge targets identified in the GSP. In addition, three projects have been identified that support demand-side reduction activities through conservation measures, including water use efficiency upgrades. Currently, no pumping restrictions have been proposed for the Subbasin; however, GSAs maintain the flexibility to implement such demand-side management actions in the future if need is determined. Additional management activities are:

- Monitoring and recording of groundwater levels and groundwater quality data
- Maintaining and updating the DMS with newly collected data
- Annual monitoring of progress toward sustainability
- Annual reporting of Subbasin conditions to DWR as required by SGMA

As part of the effort to respond to DWR's comments on the GSP in June 2022, projects and management actions were incorporated into a version of the ESJWRM Projected Conditions Baseline (PCBL) and ESJWRM Projected Conditions Baseline with Climate Change (PCBL-CC) to evaluate the impacts of such projects on the overall water budget of the Subbasin. Initially, all the projects from the GSP and 2022 Sustainable Groundwater Management (SGM) Grant

¹ 20 wells were included in the representative monitoring network for groundwater levels in the GSP. An additional well (01S10E04C001M) was added during WY 2020 in an effort to fill identified data gaps in the Subbasin.

Program's SGMA Implementation Round 1 application were considered. Based on updates in previous annual reports and information from representatives of the GSAs, these projects were categorized as Category A or B based on how likely they were to be online by 2040, how likely they were to advance in the next five years, and if they already had the necessary water rights and/or agreements to proceed with the project. Category A included 11 projects (indicated in the table in **Appendix A)** that were simulated in ESJWRM and tested against varying hydrologic, water supply, and demand conditions in the PCBL and PCBL-CC scenarios. Model results indicated that with the 11 Category A projects in place, the Subbasin is not projected to experience groundwater level undesirable results (defined as at least 25 percent of representative monitoring network wells exceeding groundwater level minimum thresholds for two consecutive years) even under climate change conditions.

Custoine bility	Undesirable Results	Identification of	Measurable	Minimum
Sustainability Indicator	Undesirable Results	Undesirable		Threshold
mulcator		Results	Objective	Threshold
Chronic lowering of groundwater levels	An undesirable result is experienced if sustained groundwater levels are too low to satisfy beneficial uses within the Subbasin over the planning and implementation horizon of the GSP.	Undesirable results occur when more than 25% of representative monitoring wells (5 of 20 ¹ wells in the Subbasin) fall below their minimum elevation thresholds for two consecutive years that are categorized as non-dry years (below-normal, above-normal, or wet), according to the San Joaquin Valley Water Year Hydrologic Classification.	At each of 20 ¹ representative wells, the measurable objective was defined based on the deeper of 1992 or 2015-2016 groundwater level values.	The deeper of 1992 and 2015-2016 groundwater levels with a buffer of 100 percent of historical range applied, or the 10th percentile domestic well depth within a 3- mile radius of the monitoring well, ² whichever is shallower. In municipalities with ordinances requiring the use of municipal water, the 10th percentile municipal well depth is used in place of the 10th percentile domestic well depth criteria.

Table 2. Summary of Sustainable Management Criteria²

Eastern San Joaquin Groundwater Authority

² These SMCs represent those established in the 2022 Revised ESJ GSP. Many of these SMCs are currently being reevaluated as part of the 2025 Periodic Evaluation and Plan Amendment and therefore may be subject to change.

Sustainability Indicator	Undesirable Results	Identification of Undesirable Results	Measurable Objective	Minimum Threshold
Reduction in groundwater storage	An undesirable result is experienced if sustained groundwater storage volumes are insufficient to satisfy beneficial uses within the Subbasin over the planning and implementation horizon of the GSP. Undesirable results related to groundwater storage are not present and are not likely to occur in the Subbasin.	Undesirable results would occur if groundwater storage volumes were depleted by 23 MAF (e.g., 30 MAF of freshwater remain in storage).	Management of reduction in groundwater storage is performed using groundwater levels as a proxy.	Management of reduction in groundwater storage is performed using groundwater levels as a proxy.
Degraded water quality	An undesirable result is experienced if SGMA- related groundwater management activities cause significant and unreasonable impacts to the long-term viability of domestic, agricultural, municipal, environmental, or other beneficial uses over the planning and implementation horizon of the GSP.	Undesirable results occur when more than 25% of representative monitoring wells (3 of 10 wells in the Subbasin) exceed the minimum thresholds for water quality for two consecutive years and where these concentrations are the result of groundwater management activities.	At each of 10 representative wells, 600 mg/L TDS. The measurable objective is close to the recommended SMCL of 500 mg/L and significantly below the upper limit SMCL of 1,000 mg/L.	At each of 10 representative wells, 1,000 mg/L TDS, consistent with the upper SMCL and developed based on the crop tolerances for fruit and nut trees and vineyards.

Sustainability Indicator	Undesirable Results	Identification of Undesirable Results	Measurable Objective	Minimum Threshold
Saltwater migration	An undesirable result is experienced if sustained groundwater salinity levels caused by saltwater migration and due to groundwater management practices are too high to satisfy beneficial uses within the basin over the planning and implementation horizon of the GSP. Saltwater migration is not present and is not likely to occur in the Eastern San Joaquin Subbasin.	Undesirable results are considered to occur during GSP implementation when 2,000 mg/L chloride reaches an established isocontour line and where these concentrations are caused by intrusion of a seawater source as a result of groundwater management activity.	500 mg/L chloride concentrations at an established isocontour line along the western portion of the Subbasin.	2,000 mg/L chloride concentrations at the established isocontour line along the western portion of the Subbasin. An action plan is in place to trigger additional monitoring and analysis at detections of 1,000 mg/L chloride in the monitoring network to confirm seawater source.
Land subsidence	An undesirable result is experienced if the occurrence of land subsidence substantially interferes with beneficial uses of groundwater and infrastructure within the Subbasin over the planning and implementation horizon of the GSP. There are no historical records of significant and unreasonable impacts from subsidence in the Subbasin.	An undesirable result occurs when subsidence substantially interferes with beneficial uses of groundwater and surface land uses. Undesirable results would occur when substantial interference with land use occurs, including significant damage to canals, pipes, or other water conveyance facilities.	Management of land subsidence is performed using groundwater levels as a proxy.	Management of land subsidence is performed using groundwater levels as a proxy.

Sustainability	Undesirable Results	Identification of	Measurable	Minimum
Indicator		Undesirable Results	Objective	Threshold
Depletions of interconnected surface water	An undesirable result is experienced if the depletions of interconnected surface water causes significant and unreasonable adverse effects on beneficial uses of surface water within the Subbasin over the planning and implementation horizon of the GSP.	An undesirable result occurs when depletions result in reductions in flow or levels of major rivers and streams that are hydrologically connected to the basin such that the reduced surface water flow or levels have a significant and unreasonable adverse impact on beneficial uses and users of the surface water.	Management of depletions of interconnected surface water is performed using groundwater levels as a proxy.	Management of depletions of interconnected surface water is performed using groundwater levels as a proxy.

Notes:

1 20 wells were included in the representative monitoring network for groundwater levels in the GSP. An additional well (01S10E04C001M) was added during WY 2020 in an effort to fill identified data gaps in the Subbasin.

2 A radius of 2 miles was used for well 03N07E21L003 to reflect domestic well depths in close proximity to the Mokelumne River.

2.2.8 Implementation

Implementation of the GSP includes monitoring of conditions, comparing against sustainable management criteria, reporting of those conditions, evaluating the GSP, implementing adaptive management strategies, implementing projects and management actions, and funding of these activities. Data are collected through monitoring on a prescribed schedule for each monitoring network. The data collected are used to improve the understanding of the Subbasin, as well as for comparison with the sustainable management criteria. Each representative monitoring well site included in each monitoring well network has defined quantitative measurable objectives and minimum thresholds for each applicable sustainability indicator. Comparison of monitoring well data and measurable objectives allow for assessment and tracking of undesirable results.

While undesirable results are not anticipated, should groundwater levels at representative monitoring sites begin to approach minimum thresholds, the ESJGWA will convene a working group to evaluate adaptive management strategies, such as the implementation of groundwater pumping curtailments, land fallowing, etc. Further, the total percentage of representative sites

exceeding minimum thresholds will be calculated and compared against the percentage which has been identified as reflective of undesirable results.

Implementation activities are reported in annual reports due April 1st of each year and include conditions and activities from the previous water year. This WY 2023 report is the fifth annual report to be prepared following GSP submittal on January 31, 2020. Evaluation reports will also be developed every five years to document progress on implementation and to reconsider elements of the GSP.

The Eastern San Joaquin Subbasin applied for funding under the Proposition 68 Sustainable Groundwater Planning Grant Program, Round 3. The ESJGWA was awarded \$500,000 on January 24, 2020 and will be used to install additional monitoring wells adjacent to the Delta to assess cross-boundary flows in the area, improve the existing DMS, and design a Rate Study to develop a cost allocation framework that will help the Subbasin identify how costs for implementation activities will be distributed between GSAs. Additionally, the ESJGWA recently received funding under the Proposition 68 Sustainable Groundwater Management Grant Program – Critically Overdrafted Basin SGMA Implementation Round 1 to implemented at the GSA level and include monitoring and reporting, model verification efforts, and public engagement and outreach. Finally, the ESJGWA submitted a grant application under the Proposition 68 Sustainable Grant Program Round 2 for additional funding to further implementation of the identified projects. Unfortunately, the Subbasin's funding application was not successful.

3. GROUNDWATER DATA ANALYSIS SUMMARY

This section discusses hydrologic conditions, groundwater elevation trends, groundwater quality, and groundwater-surface water interaction in the Eastern San Joaquin Subbasin.

3.1 HYDROLOGIC CONDITIONS:

Rainfall data derived from the PRISM (Precipitation-Elevation Regressions on Independent Slopes Model) dataset of the DWR's California Simulation of Evapotranspiration of Applied Water (CALSIMETAW) model indicate a Subbasin average of 28.9 inches of rainfall during WY 2023. This represents approximately 182% of the long-term (WY 1969-2022) Subbasin average precipitation of 15.9 inches. San Joaquin River flow at Vernalis for the same period had an average monthly discharge of approximately 6,410 thousand acre-feet, representing about 99% of the long-term (WY 1930-2020) average flow at that location (USGS, 2023). The Cosumnes River at Michigan Bar for this period had an average monthly discharge of approximately 265% of the long-term (WY 1965-2020) average flow at that location (USGS, 2023); and the Calaveras River flow below New Hogan Dam had an average monthly discharge of approximately 7.9 thousand acre-feet, representing about 242% of the long-term (WY 1965-2020) average flow at that location (US Army Corps of Engineers, 2023).

3.2 GROUNDWATER LEVELS:

Figure 2 shows the location of the representative wells identified in the GSP monitoring network for the chronic lowering of groundwater levels. Individual hydrographs³, charts of groundwater levels over time, for these wells are included in **Appendix B**. The hydrographs display historical trends of groundwater levels in the Subbasin through WY 2023, contingent upon data availability. All available data are shown (DWR, 2023b). Hydrographs for representative monitoring wells also display the quantitative minimum threshold and measurable objective that were developed in Chapter 3 (Sustainable Management Criteria) of the GSP.

All hydrographs show yearly cycles of groundwater level declines in summer due to typical patterns in groundwater pumping and recharge during winter recovery. Of the 21 representative monitoring wells, 17 wells reported groundwater levels for Fall 2022 and 18 wells reported groundwater levels in Spring 2023 as shown in **Table 7**. Wells that were not monitored were noted as "Inaccessible" during these two time periods and therefore measurements could not be collected.

According to DWR's Dry Well Reporting System, Eastern San Joaquin Subbasin had 12 reported water shortages from dry wells in the 365 days prior to the preparation of this report (DWR, 2023a).

³ Except where noted, groundwater levels in hydrographs were converted to the North American Vertical Datum of 1988 (NAVD88), consistent with CASGEM groundwater data reporting.

Hydrographs showing WY 2023 for wells in the broad monitoring network are included in **Appendix C**. All monitoring data collected in WY 2023 are included in a table in **Appendix D**.

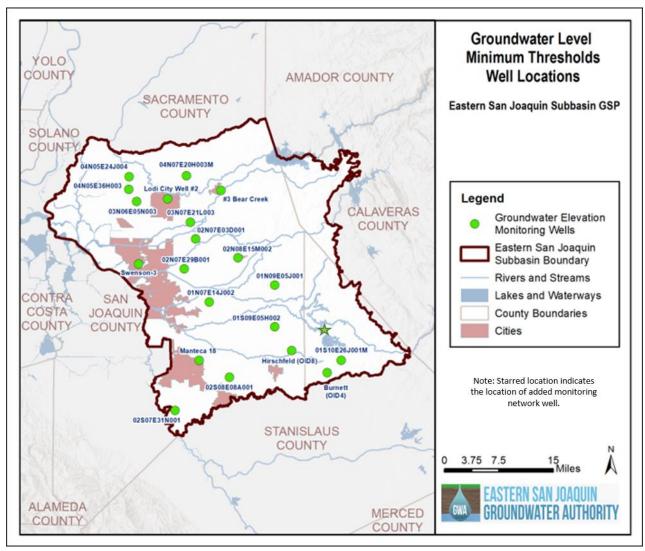

Figure 2. Groundwater Level Representative Monitoring Well Locations

3.2.1 Comparison of Current and Historical Spring Groundwater Levels

A comparison of Spring 2023 groundwater levels with the range of historical spring levels for representative wells in the Subbasin shows a general trend of increasing groundwater levels over Spring 2022. Groundwater levels increased an average of 1.8 feet between Spring 2022 and Spring 2023 for representative wells with WY 2022 and WY 2023 data. This trend correlates with the significantly wet WY 2023 that followed two critically dry water years (WY 2022 and WY 2021).

3.2.2 Groundwater Level Contour Maps:

Groundwater level contour maps were developed as part of this annual report to represent seasonal high and seasonal low groundwater conditions. Fall 2022 (September and October 2022) and Spring 2023 (March, April, May 2023) groundwater elevation maps are included in **Figure 3** and **Figure 4**.

Previous work expanded the groundwater level period to include September and May for seasonal low and seasonal high readings, respectively. This definition was used again in this year's annual report. This approach reduces the impact of disruptions to the monitoring data quality used to develop the groundwater contour map by increasing the number of groundwater level measurements considered during contour development. This also allowed the analysis to capture a larger dataset and better represent current conditions.

Groundwater levels in the center of the Subbasin fell slightly between Spring of WY 2022 and the beginning of WY 2023 (Fall 2022). Between Fall WY 2023 (Fall 2022) and Spring WY 2023 (Spring 2023), groundwater levels increased, particularly in the center of the basin, reflecting the wet conditions of the winter season during WY 2023 (January to March of 2023) that caused a more extreme seasonal rise in groundwater levels.

Groundwater elevation contours shown in **Figure 3** and **Figure 4** used the Inverse Distance Weighting (IDW) interpolation method (as opposed to the spline interpolation used in the GSP) as the IDW method better represented the updated data set. Areas where there were limited WY 2023 data available are indicated with hash marking on both figures. There is a notable data gap on the eastern side of the Subbasin. Installation of new monitoring wells in these regions as part of GSP implementation, as well as corresponding changes to groundwater level monitoring, will be critical in filling these data gaps.

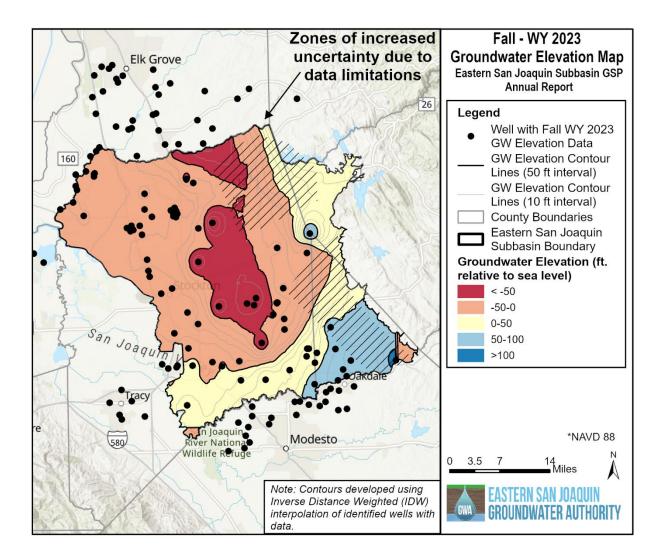

Figure 3. Seasonal Low Groundwater Levels in the Eastern San Joaquin Subbasin, based on data from September 2022 (WY 2022) and October 2022 (WY 2023)

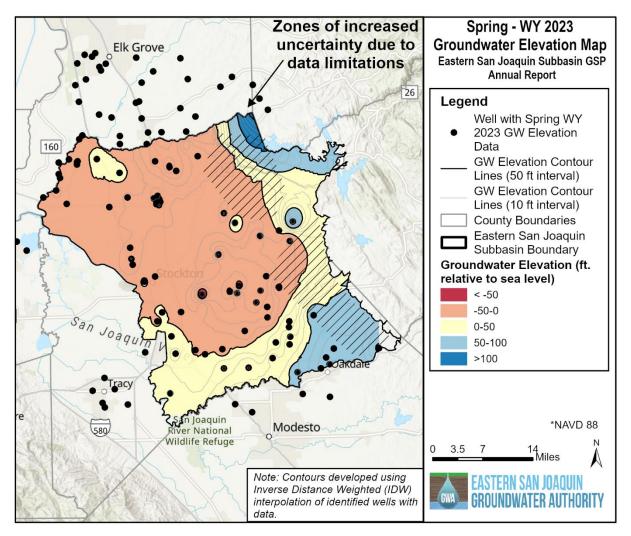

Figure 4. Seasonal High Groundwater Levels in the Eastern San Joaquin Subbasin, based on data from March, April, and May 2023 (WY 2023)

3.3 CHANGE IN GROUNDWATER STORAGE

Change in groundwater storage is estimated using the ESJWRM. **Figure 5** shows the annual and cumulative change in storage from WY 1996 to 2023 for the Eastern San Joaquin Subbasin. In WY 2023 (October 1, 2022 to September 30, 2023), the Eastern San Joaquin Subbasin saw an increase of groundwater in storage of approximately 69,500 AF, reflecting the very wet conditions of the year. **Figure 5** indicates negative "Change in Storage", meaning that inflows (consisting of deep percolation, recharge, flow from streams, and boundary inflows) were greater than outflows in WY 2023. **Figure 6** adds all inflows together to highlight the annual change in storage. **Figure 7** shows this inverse "Change in Storage" plotted with "Groundwater Pumping" and "Cumulative Change in Storage."

Figure 8 shows the change in groundwater storage for the Eastern San Joaquin Subbasin by ESJWRM element between October 1, 2022 and September 30, 2023. On an ESJWRM element basis, groundwater storage was estimated to increase or decrease by 0.25 feet over much of the Subbasin, with an area of decrease of up to 1 foot in the southwestern portion of the Subbasin due to increased agricultural groundwater pumping as compared to WY 2022. The north-central portion of the Subbasin and the southwestern corner bordering Tracy Subbasin experienced the largest increase in storage in comparison to WY 2022, with a 2-foot increase through WY 2023. Though change in storage varied on an ESJWRM element basis, there was an overall net increase in groundwater storage in the Eastern San Joaquin Subbasin during WY 2023 as previously stated and reflected in **Figure 5** to **Figure 7** and mapped in **Figure 8**.

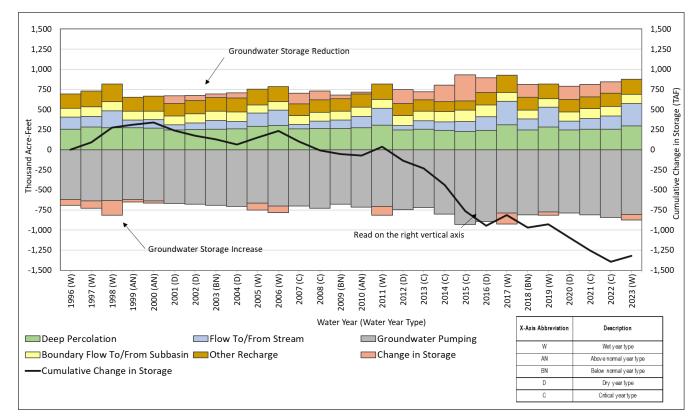

Figure 5. Modeled Change in Annual Storage with Water Use and Year Type

Notes:

- Water Year Types based on San Joaquin Valley Water Year Index (CA DWR, 2024). Water Year 2023 classification is wet (W) based on the hydrologic conditions for this analysis, however, the San Joaquin Valley Water Year Index has not yet published the WY 2023 designation.
- 2. "Other Recharge" includes managed aquifer recharge, recharge from unlined canals and/or reservoirs, and recharge from ungauged watersheds.
- 3. "Change in Storage" balances the water budget. For instance, if annual outflows (-) are greater than inflows (+), there is a decrease in storage, but this would be shown as storage depletion on the positive side of the bar chart to balance out the increased outflows on the negative side of the bar chart.
- 4. The uncertainty associated with estimating change in storage using ESJWRM was evaluated using sensitivity analysis. This analysis indicates that the average difference in change in storage estimates varies approximately 47% across all sensitivity runs.

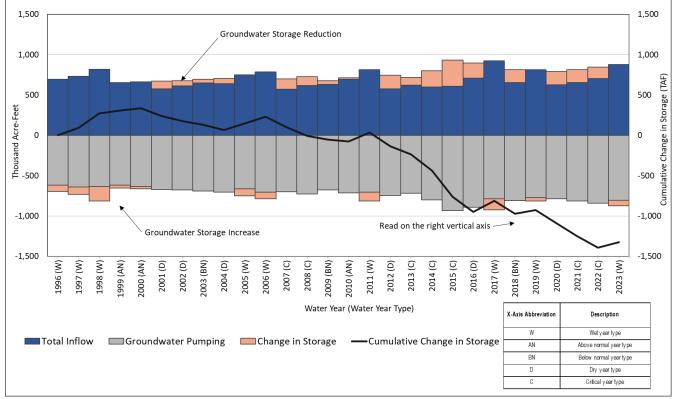

Figure 6. Modeled Change in Annual Storage with Inflows and Year Type

Notes:

- Water Year Types based on San Joaquin Valley Water Year Index (CA DWR, 2024). Water Year 2023 classification is wet (W) based on the hydrologic conditions for this analysis, however, the San Joaquin Valley Water Year Index has not yet published the WY 2023 designation.
- 2. "Total Inflow" includes "Deep Percolation", "Flow To/From Stream", "Other Recharge", and "Boundary Flow To/From Subbasin" from **Figure 5**.
- 3. "Change in Storage" balances the water budget. For instance, if annual outflows (-) are greater than inflows (+), there is a decrease in storage, but this would be shown as storage depletion on the positive side of the bar chart to balance out the increased outflows on the negative side of the bar chart.

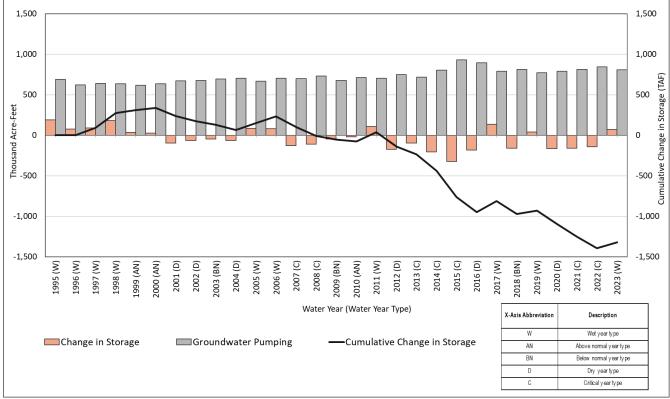

Figure 7. Modeled Change in Annual Storage with Groundwater Pumping and Year Type

Notes:

- Water Year Types based on San Joaquin Valley Water Year Index (CA DWR, 2024). Water Year 2023 classification is wet (W) based on the hydrologic conditions for this analysis, however, the San Joaquin Valley Water Year Index has not yet published the WY 2023 designation.
- 2. "Groundwater Pumping" and "Change in Storage" are the inverse of what is shown in **Figure 5** and **Figure 6**. In this figure, a positive "Change in Storage" indicates an increase in groundwater storage, while a negative "Change in Storage" indicates a decrease in groundwater storage. These changes are directly reflected in the "Cumulative Change in Storage" line. The annual "Groundwater Pumping" is shown adjacent to the "Change in Storage" for the same year.

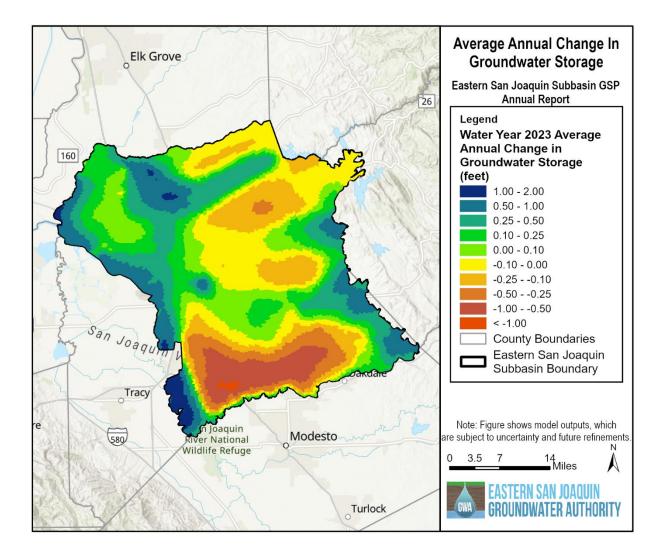

Figure 8. Eastern San Joaquin Subbasin WY 2023 Change in Storage

3.4 GROUNDWATER QUALITY

While groundwater quality in the Eastern San Joaquin Subbasin is generally sufficient to meet beneficial uses and is on track to surpass measurable objectives, there are a few constituents of concern that are either currently impacting groundwater use or could impact groundwater in the future. Each water quality parameter may be naturally occurring or anthropogenic in source, as well as localized or widespread. The primary naturally occurring water quality constituents of concern in the Eastern San Joaquin Subbasin are salts and arsenic. The primary water quality constituents related to human activity include nitrates, salts, and various point-source contaminants such as petroleum hydrocarbons, solvents, and emerging contaminants. Historical groundwater quality conditions for these constituents are described in Section 2.2.4 in the GSP.

A primary maximum contaminant level (MCL) or secondary maximum contaminant level (SMCL) is defined for a variety of parameters. For the purposes of this GSP, comparing parameter concentrations to their MCL or SMCL is used as the basis for describing groundwater quality concerns in the Eastern San Joaquin Subbasin. Water quality has generally not significantly affected beneficial uses of groundwater in the Eastern San Joaquin Subbasin.

Through GSP implementation, monitoring networks for water guality are tested for TDS, cations and anions (including chloride and nitrate), arsenic, and field parameters including pH, electrical conductivity (EC), and temperature. Arsenic and nitrate are monitored for informational purposes only and to track trends in arsenic concentrations, especially as projects are implemented; the GSP does not include sustainability goals, measurable objectives, or minimum thresholds for arsenic or nitrate. Through new monitoring efforts, the GSP will document trends in monitored constituents and identify opportunities for coordination with existing programs. Through coordination with existing agencies and through additional monitoring, the ESJGWA will know if existing regulations are being met or if groundwater management activities in the Subbasin are contributing to significant and unreasonable undesirable effects related to degraded water quality. (It should be noted that arsenic and nitrate are currently regulated in the Subbasin through existing water resources monitoring and management programs such as the Irrigated Lands Regulatory Program. If groundwater quality conditions violate those regulations, or if monitoring efforts indicate concerning trends, the ESJGWA will take steps to coordinate with regulatory agencies implementing those programs and will evaluate establishing minimum thresholds and measurable objectives for these constituents at that time.)

Ten representative monitoring wells were selected to be monitored for water quality. These wells are currently monitored and managed by City of Manteca, Cal Water, City of Stockton, and San Joaquin County. These measurements are logged in **Table 8** in Section 4.1.3, Progress Toward Implementation of this Annual Report. Details regarding the status of wells that were not sampled during WY 2023 are also included. There were no minimum threshold exceedances to report for WY 2023.

The broad monitoring network for water quality includes sampling from five identified local water quality wells and 16 nested and/or clustered well sites that are also monitored for groundwater levels in the broad monitoring network for groundwater levels.

3.4.1 Total Dissolved Solids Measurements in Representative Monitoring Network Wells

During WY 2023, TDS measurements were reported from five of the ten representative monitoring wells for water quality. The five wells without data were not sampled for a variety of reasons, including due to inactive wells as a result of PFOA impacts. The most recent figures available are included in footnotes beneath **Table 8**, and the locations of the ten representative monitoring wells are shown in **Figure 9**. There were no minimum threshold exceedances to report for WY 2023.

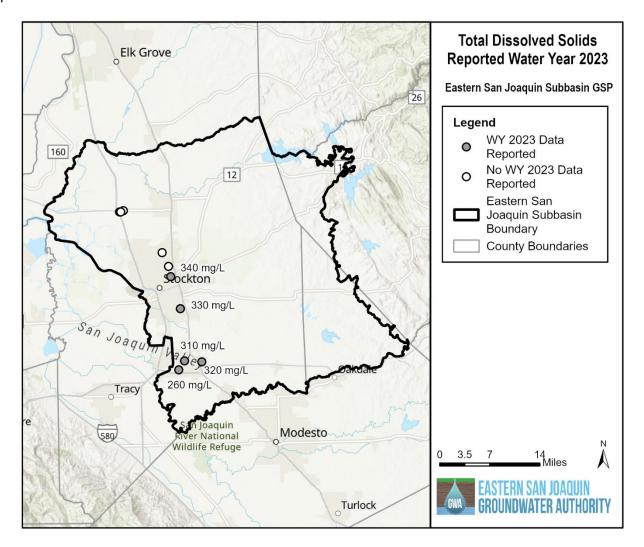

Figure 9. Water Year 2023 Total Dissolved Solids Measurements at Representative Monitoring Well Sites

3.4.2 Contaminated Sites

At the time of preparation of this annual report, there were 110 open or active point source contamination sites identified by GeoTracker in the Eastern San Joaquin Subbasin. Of these, there are 58 sites that have ongoing cleanup programs in progress, 49 of these sites are identified as locations of leaking underground storage tanks (LUSTs), and 3 are military cleanup sites that are being remediated. There is one Superfund site within the Subbasin boundary, in the City of Stockton (SWRCB, GeoTracker, 2024a). Real-time data on contaminated sites added during a single water year are limited and variable. However, updates regarding the status of contaminated sites within the Eastern San Joaquin Subbasins will be provided in subsequent Annual Reports where information is available.

3.4.3 Regional Groundwater Quality

The primary naturally occurring water quality constituents of concern are salinity and arsenic, while primary water quality constituents related to human activity include nitrates, salinity, and various point-source contaminants. According to the 2024 Aquifer Risk map, which shows aquifer risk based on groundwater that may not be meeting primary drinking water standards, water quality across the Subbasin is most degraded along the western side of the Subbasin, particularly in the southwest corner of the Subbasin and around the cities of Stockton and Lodi. Nitrate and arsenic are designated as High Risk in these areas. High Risk areas for arsenic are mostly concentrated right along the western boundary of the Subbasin and High Risk areas for nitrate cover much of the western half of the Subbasin (SWRCB, 2023b).

3.5 SALTWATER MIGRATION

As described in the GSP, the ESJGWA monitors chloride concentrations to support information collection and early detection of saltwater intrusion and will report chloride concentrations to DWR in each annual report. While saltwater migration is not expected to occur, the GSP established monitoring protocols for the early detection of saltwater migration were it ever to occur. Chloride measurements were reported at five of the ten representative monitoring wells for water quality. The remaining five representative monitoring wells were not sampled for a variety of reasons, including inactive wells due to PFOA impacts. These figures are included in **Table 9** and are shown visually in **Figure 10**. There were no minimum threshold exceedances for saltwater migration to report for WY 2023.

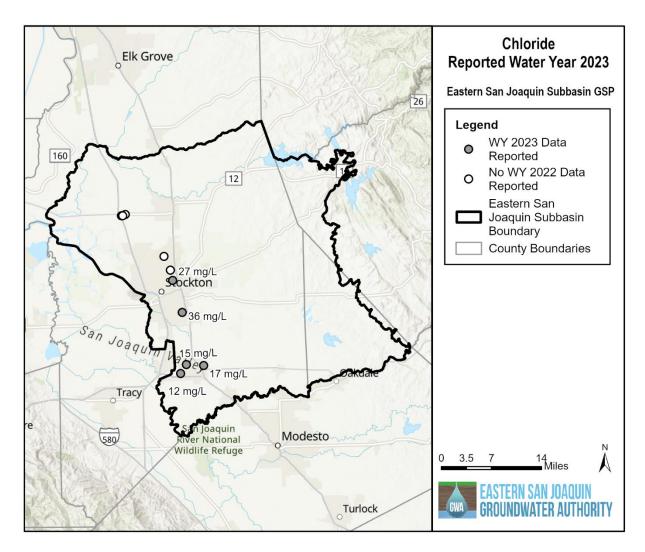

Figure 10. Water Year 2023 Chloride Measurements at Representative Monitoring Well Sites

3.6 LAND SUBSIDENCE

SGMA considers the impact of groundwater management actions on land subsidence through the land subsidence sustainability indicator. In the Eastern San Joaquin Subbasin, the land subsidence sustainability indicator uses the groundwater level sustainability indicator as a proxy. Minimum thresholds for groundwater levels are protective of significant and unreasonable impacts to land subsidence, as described in the GSP. There were no minimum threshold exceedances for groundwater levels; therefore, there are no land subsidence impacts to report for WY 2023.

Additionally, per publicly available datasets, there are three Continuous GPS subsidence monitoring stations in the Subbasin (P273, CNDR and P309) that were measured during WY

2023 along with InSAR data released by DWR. Data from these other sources support the Subbasin results that there were no land subsidence impacts in WY 2023.

3.7 GROUNDWATER-SURFACE WATER INTERACTION

SGMA considers the impact of groundwater management actions on groundwater-surface water interactions through the depletions of interconnected surface water sustainability indicator. In the Eastern San Joaquin Subbasin, the depletions of interconnected surface water sustainability indicator use the groundwater level sustainability indicator as a proxy. Minimum thresholds for groundwater levels are protective of significant and unreasonable impacts to interconnected surface waters, as described in the GSP. There were no minimum threshold exceedances for groundwater levels; therefore, there are no groundwater-surface water interaction impacts to report for WY 2023.

3.8 TOTAL WATER USE

3.8.1 Groundwater Extraction

Groundwater pumping data are available only from a limited number of metered wells within the Eastern San Joaquin Subbasin, with the remainder of extraction information estimated using ESJWRM⁴. Metered data are available from municipal water purveyors (Cal Water, City of Escalon, City of Lodi, City of Manteca, City of Ripon, City of Stockton, LCSD, and SEWD). Agricultural, private domestic, and other groundwater production in the Subbasin is largely unmetered and were estimated using the ESJWRM, which bases water use on crop type, hydrologic data (precipitation and evapotranspiration), irrigation efficiency, and population information. WY 2023 metered groundwater production data were not available from LCWD and therefore was also estimated using the ESJWRM using the same approach.

Figure 11 shows the general location and volume of groundwater pumping within the Subbasin by ESJWRM element for WY 2023. Large portions of the Subbasin elements experience very little pumping, between 0.0 to 0.5 AF/acre, while areas with agriculture or municipal pumping wells have pumping ranging from 0.5 to approximately 10 AF/acre. Groundwater pumping decreased overall between WY 2022 and WY 2023, likely due to the availability of surface water as a result of the very wet winter season during WY 2023.

In WY 2023, total groundwater use in the Eastern San Joaquin Subbasin was estimated at 805,994 AF across water use sectors, as shown in **Table 3**. As the estimated sustainable yield of the Eastern San Joaquin Subbasin is 715,000 AFY \pm 10 percent over the long-term, pumping may exceed the sustainable yield during certain years, balanced by other years with reduced

⁴ A pilot project was undertaken in SEWD to test use of satellite technology to measure and quantify crop evapotranspiration. These measurements, in combination with known data on surface water deliveries, could provide a more direct measure of groundwater pumping for agricultural irrigation. The approach will be further evaluated and may be used along with modeling to quantify agricultural groundwater extractions in the future.

pumping so that the long-term average remains at or below the sustainable yield. The groundwater use simulated in ESJWRM over the last 14 years (WY 2010-2023) ranged from a low of about 705,000 AF in WY 2011 (wet year) to a high of about 932,000 AF in WY 2015 (critical year), with 5 of the 13 simulated years staying within the range of the sustainable yield due to two droughts occurring during the simulation period. It is important to note that the ESJWRM was recently updated and recalibrated with more recent data; however, the Subbasin sustainable yield has not been recalculated following model's updated calibration. This sustainable yield estimate will be re-evaluated as part of the 2025 Periodic Evaluation and Plan Amendment effort.

3.8.2 Surface Water Supply

Surface water delivery data are available from purveyors in the Subbasin and include deliveries for urban and industrial use (City of Lodi; City of Manteca; and City of Stockton, including Cal Water and unincorporated portions of San Joaquin County) and deliveries for agricultural use (CSJWCD, NSJWCD, OID, SSJID, SEWD, and WID). The remaining surface water use is estimated in the ESJWRM and includes riparian diversions occurring in the CDWA, SDWA, and along major Subbasin rivers. WY 2023 surface water delivery data were not available from CCWD and therefore were also estimated in ESJWRM. Sources of surface water in the Subbasin include Calaveras River, Mokelumne River, San Joaquin River, and Stanislaus River. Surface water deliveries during WY 2023 are estimated to be 553,840 AF for the Eastern San Joaquin Subbasin (**Table 4**), with most of the surface water used between May and September.

Conjunctive use is the use of surface water in coordination with groundwater to allow the Subbasin to recharge and store additional water supply, either through in-lieu use or direct recharge. In-lieu recharge occurs for both agricultural and municipal purveyors wherever surface water is being delivered to offset groundwater that would have otherwise been used. Agencies conducting in-lieu recharge include Cal Water, CCWD, City of Escalon, City of Lodi, City of Manteca, City of Ripon, City of Stockton, CSJWCD, LCWD, LCSD, NSJWCD, OID, SSJID, SEWD, and WID. While in-lieu recharge was not quantified separately in this report, estimates may be made in future annual reports.

Direct recharge projects exist in NSJWCD and SEWD and recharged over 10,200 AF in WY 2023. These projects use water from the Calaveras River, Mokelumne River, and Stanislaus River and include NSJWCD's Tracy Lake Groundwater Recharge Project; NSJWCD's Cal-Fed/Costa Recharge project; NSJWCD's Reynolds Recharge project; NSJWCD's Tecklenburg, Miller, and Bear Creek/Pixley Slough Recharge projects; and SEWD's Farmington Groundwater Recharge Program.

3.8.3 Total Water Use

Total water use is the sum of the groundwater use and surface water use. Total water use during WY 2023 is estimated to be 1,359,834 AF for the Eastern San Joaquin Subbasin (**Table 5**). Groundwater pumping accounts for almost 60% of total water use in the Subbasin, while surface water deliveries are a little more than 40% of total water use. Due to the wet year in WY 2023

that followed the critical year in WY 2022, shifts in timing of the irrigation and harvest periods in each of those years likely impacted which water year peak demand periods were calculated within. As a result, a direct accounting comparison of total water use between WY 2022 and WY 2023 may not be representative of the specific water year hydrologic conditions between those two years. Longer-term comparisons across multiple dry and multiple wet years show a more complete characterization of conditions within the basin.

3.8.4 Eastern San Joaquin Water Resources Model Update

The ESJWRM was originally developed and calibrated to model historical groundwater storage from water years 1996-2015. The *Eastern San Joaquin Water Resources Model Final Report* provides detailed documentation on the original development of the ESJWRM model (Woodard & Curran, 2018). The model has been updated annually to include the recent Water Year data as part of the annual report preparation to reflect more recent data. In 2021, the ESJWRM was updated and calibrated for the entire period of record from 1996-2020. Updates to the model are described in *Eastern San Joaquin Water Resources Model Version 2.0 Update* (Woodard & Curran, 2022). In late 2022, the monthly agricultural demand distribution for ESJWRM was updated in select areas of the groundwater subbasin, causing slight changes to water budget numbers, but minimal differences to overall model calibration. The version of ESJWRM used for this report was ESJWRM Version 2.2. Data for WY 2023 were collected from the same public and private sources that had provided the historical data through 2020 used in the most recent model update. As a result of the model extension, a new historical water budget was generated including updated estimates of change in groundwater storage. The full annual groundwater budget for water years 1996-2023 is shown earlier in **Figure 5**.

Data Sources

Data were requested and received from the following entities in the Subbasin to complete the ESJWRM update through WY 2023.

Agricultural Water Purveyors

- Central San Joaquin Water Conservation District
- North San Joaquin Water Conservation District
- Oakdale Irrigation District
- South San Joaquin Irrigation District
- Stockton East Water District
- Woodbridge Irrigation District

Municipal Water Purveyors

- California Water Service Company Stockton District
- City of Escalon
- City of Lodi
- City of Manteca
- City of Ripon
- City of Stockton
- Lockeford Community Services District
- Stockton East Water District

Data were not received from Calaveras County Water District or Linden County Water District for the WY 2023 model update. Additional publicly available data were downloaded to complete the ESJWRM update:

<u>State</u>

• California Department of Finance population estimates

<u>Federal</u>

- United States Geological Survey (USGS) stream flows⁶
- United States Army Corps of Engineers reservoir releases⁷

<u>Other</u>

• Precipitation-Elevation Regressions on Independent Slopes Model (PRISM) Climate Group, Oregon State University

Updated Components

The above data sources provided the necessary data to allow the historical model to reflect recent conditions. The following components of the model were updated:

Surface Water Diversions and Deliveries: Monthly surface water diversions and deliveries were provided for October 1, 2022 through September 30, 2023 for urban and industrial use and agricultural use as described in Section 3.8.2. Remaining riparian diversion occurring in CDWA, SDWA, and along major rivers were estimated based off agricultural demands estimated in ESJWRM.

Groundwater Pumping: Groundwater extraction data from October 1, 2022 through September 30, 2023 were provided by most municipal water purveyors as described in Section 3.8.1. Pumping estimates were made in ESJWRM based on land use type and population, for private agriculture wells, domestic wells, and municipal wells from water purveyors that did not have metered extraction.

Population: California Department of Finance estimates (E-4 Population Estimates for Cities, Counties, and the State, 2022-2023, with 2020 Census Benchmark) were downloaded to update annual population for 2023 (State of California, 2023). Rural populations were estimated from Department of Finance county totals and spatially assigned throughout the model by urban acreage.

Land Use: Each element within the ESJWRM is comprised of some fraction of 27 land uses, including 23 agricultural crop categories, native vegetation, water surface, riparian vegetation,

⁶ New Melones Reservoir flows are monitored at a USGS gauge downstream on the Stanislaus River below Goodwin Dam near Knights Ferry, CA.

⁷ Reservoir release for New Hogan Reservoir on the Calaveras River.

and urban landscape. For WY 2023, the model continues to utilize data from DWR's 2016 Statewide Crop Mapping which provides data on urban and irrigated land throughout the model domain on a parcel scale (DWR, 2016). Additional land use information is being incorporated into ESJWRM as part of the model update for the 2025 Periodic Evaluation and Plan Amendment effort.

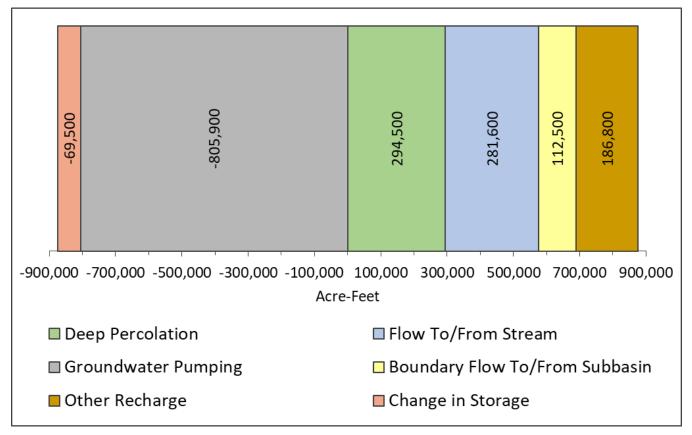

Precipitation: Rainfall data for the model area are derived from the PRISM (Precipitation-Elevation Regressions on Independent Slopes Model) database used in the DWR's CALSIMETAW (California Simulation of Evapotranspiration of Applied Water) model. The database contains daily precipitation data from October 1, 1921, on a four-kilometer grid throughout the model area. ESJWRM has monthly rainfall data defined for every model element in order to preserve the spatial distribution of the monthly rainfall. Each of the model elements was mapped to the nearest of 364 available PRISM reference nodes, uniformly distributed across the model domain. The PRISM dataset is available online from Oregon State University through a partnership with the NRCS National Water and Climate Center (Oregon State University, 2023).

Streamflow: Monthly inflow to the Eastern San Joaquin Subbasin were updated for Dry Creek, Mokelumne River, Calaveras River, Stanislaus River, and San Joaquin River. Sources of data included USGS (USGS, 2023) and United States Army Corps of Engineers (US Army Corps of Engineers, 2023). Non-gauged tributaries into the Subbasin were estimated internally by the model using the Integrated Water Flow Model (IWFM) small-watershed package.

Boundary Conditions: Averages of historical model data by water year type were used to update the assumed groundwater elevation boundary conditions in the model.

<u>Results:</u>

Evaluation of WY 2023 (**Figure 12**) shows that the Eastern San Joaquin Subbasin experienced, on an average and net basis, 875,400 AF of inflows and 805,900 AF of outflow, leading to an annual increase of groundwater in storage of 69,500 AF. Deep percolation from the root zone is the largest contributor of groundwater inflow (294,500 AFY), followed by recharge from streams (281,600 AFY); recharge from managed aquifer projects, unlined canals or reservoirs, and ungauged watersheds (186,800 AFY); and boundary flows from surrounding groundwater subbasins (112,500 AFY). Groundwater production (805,900 AFY) accounts for the greatest outflow from the Eastern San Joaquin Subbasin. **Table 6** compares these values against those from WY 2022.

Notes:

- 1. "Other Recharge" includes managed aquifer recharge, recharge from unlined canals and/or reservoirs, and recharge from ungauged watersheds.
- "Change in Storage" is placed to balance the water budget. For instance, if annual outflows (-) are greater than inflows (+), there is a decrease in storage, but this would be shown on the positive side of the bar chart to balance out the increased outflows on the negative side of the bar chart.

Figure 12. WY 2023 Average Annual Estimated Groundwater Budget, Eastern San Joaquin Subbasin

Water Budget Element	WY 2022	WY 2023
Water Year Type	Critically Dry	Wet
Deep Percolation	259,000	294,500
Other Recharge	160,000	186,800
Flow to/from Stream	159,000	281,600
Boundary Flow to/from Subbasin	119,000	112,500
Groundwater Pumping	-819,000	-805,900
Change in Storage	122,000	-69,500

Table 6. Comparison of WY 2022 and WY 2023 Water Budget (in acre-feet)

Note: a negative Change in Storage value reflects an increase in the amount of water added to the Subbasin.

4. PROGRESS TOWARD IMPLEMENTATION

Throughout the GSP development process, measurable objectives, interim milestones, and minimum thresholds for applicable sustainability indicators, as well as projects and management actions, were identified to aid in maintaining sustainable conditions throughout the Subbasin. Implementation progress of projects, management actions, and adaptive management activities are detailed in **Appendix A**. The following sections describe progress made in achieving the interim milestones identified in the GSP for groundwater levels and groundwater quality.

Groundwater levels are used as a proxy for reduction in groundwater storage, land subsidence, and depletion of interconnected surface water. Monitoring for saltwater migration is conducted in conjunction with measuring chloride concentrations through the groundwater quality representative monitoring network wells. The ESJWRM was used to quantify recent changes in groundwater storage to reflect WY 2016 to 2023 for this Annual Report, described in Section 3.3. During WY 2023, conditions relative to all thresholds for all applicable sustainability indicators were considered sustainable.

It should be noted that since early 2020, GSP implementation has been affected by the coronavirus pandemic (COVID-19) as GSA employees were encouraged to work from home and avoid public gatherings to prevent the spread of the virus. Pandemic restrictions may have also delayed implementation progress of projects, management actions, and adaptive management activities between 2020-2022. However, progress in WY 2023 showed many agencies are back on track toward project implementation, as described in **Appendix A**.

4.1 CURRENT CONDITIONS FOR EACH SUSTAINABILITY INDICATOR

4.1.1 Groundwater Levels

An analysis was performed to determine conditions relative to established thresholds (including interim milestones for 2025, measurable objectives, and minimum thresholds) during WY 2023 for the chronic lowering of groundwater levels sustainability indicator (**Table 7**). All representative monitoring network wells, except 02N08E15M002 and 02N07E03D001, were monitored in WY 2023 at least once. Attempts were made to monitor three wells (Swenson-3, 02N07E03D001, and 04N05E24J004) in Fall 2022, but they were deemed temporarily inaccessible. Two of those wells became accessible by Spring 2023. Groundwater levels at these wells will be reported in future annual reports. Hydrographs with historical data at each of the 21 representative monitoring network wells are included in **Appendix B**.

Water levels fluctuated around the measurable objective for multiple representative wells, remaining an average of <1 feet below the measurable objectives in Fall 2022, and 3 feet above the measurable objectives in Spring 2023. Eight representative wells (01S09E05H002, Manteca 18, 01S10E26J001M, #3 Bear Creek, OID-8, OID-4, 02S08E08A001, and 01S10E04C001M1) reported Spring 2023 levels that were below the measurable objective. Water levels remained an average of 29.9 feet above the minimum threshold for all representative wells with reported

data in Spring 2023. No wells reported groundwater levels below the minimum threshold, and as a result, no undesirable results were triggered as specified by the sustainable management criteria set in the GSP.

As defined in the GSP, interim milestones are established as the current condition for the first 10 years and then follow a linear trend between the current condition and the measurable objective. Of wells that were sampled, groundwater level measurements in Fall 2022 (seasonal low) were approximately 3 feet below their 2025 interim milestones on average. Twelve wells were below their respective interim milestones, and 6 wells exceeded it.

Table 7. Chronic Lowering of Groundwater Levels Threshold Analysis:

* Groundwater level data for WY 2023 unavailable.

** Well temporarily inaccessible. No measurement was taken.

⁸ This well is a new representative monitoring network well since GSP development. Interim Milestones for 2025 have not been established.

*** Field team was not able to locate well at time of sampling due to excess debris covering the wellhead.

Eastern San Joaquin Groundwater Authority

This page left blank intentionally.

4.1.2 Groundwater Storage

The GSP uses groundwater level minimum thresholds, measurable objectives, and interim milestones as a proxy for the reduction in groundwater storage sustainability indicator. An analysis to determine conditions relative to established thresholds (including interim milestones for 2025, measurable objectives, and minimum thresholds) during WY 2023 for the chronic lowering of groundwater levels sustainability indicator is described in Section 3.2. The ESJWRM was updated to estimate the changes in groundwater storage during WY 2023, as described in Section 3.3.

4.1.3 Groundwater Quality

An analysis was performed to determine conditions relative to established sustainable management criteria (including interim milestones for 2025, measurable objectives, and minimum thresholds) during WY 2023 for the degraded water quality sustainability indicator (**Table 8**). During WY 2023, TDS was sampled at 119-075-01, Manteca Wells 15, 16, and 17, Stockton SSS8, and Flag City Wells 1, 2, and 3. TDS was not sampled at Stockton 10R and 26. Stockton 26 was decommissioned during the previous reporting period and will be replaced by a neighboring well in the City of Stockton. In the interim, nearby wells Stockton 27 and 31 were sampled for TDS and are included in **Table 8**. No wells that were sampled in WY 2023 exceeded their minimum thresholds.

As defined in the GSP, interim milestones are established following a linear trend between current conditions and the measurable objectives. All wells that were sampled had concentrations lower than their measurable objectives and the 2025 interim milestones.

In the case of Wells 1, 2, and 3, no monitoring was completed within WY 2023, but samples were taken at the beginning of WY 2024. The results from this sampling event are included in **Table 8** and represent the most recent data available at these wells.

Additional groundwater quality data will be collected and reported moving forward as part of GSP implementation.

Well ID	Interim Milestone -2025	Measurable Objective	Measurable Objective Minimum Threshold		WY 2023, if available**		
Weinib	(Total Dissolved Solids, mg/L)	(Total Dissolved Solids, mg/L)	(Total Dissolved Solids, mg/L)	(Total Dissolved Solids, mg/L)	Date of Measurement	(Total Dissolved Solids, mg/L)	
Well 1	525	600	1,000	500	11/08/2023	470	
Well 2	532.5	600	1,000	510	11/08/2023	590	
Well 3	532.5	600	1,000	510	11/08/2023	570	
Stockton 10R	391.5	600	1,000	322	**	**	
Stockton 26	412.5	600	1,000	350	Well Inactive	Well Inactive

Table 8. Degraded Water Quality Threshold Analysis

* Calculated by averaging 2012-2018 data due to limitations on data availability.

** For wells where Water Year 2023 data are unavailable, the current conditions presented in the GSP represent the most recent available information, unless noted otherwise.

⁹ Proposed replacement option for Stockton 26 in the GSP.

¹⁰ Proposed replacement option for Stockton 26 in the GSP.

This page left blank intentionally.

4.1.4 Saltwater Migration

An analysis was performed to determine conditions relative to established sustainable management criteria (including measurable objectives and minimum thresholds) during WY 2023 for the saltwater migration sustainability indicator (**Table 9**). Chloride concentrations were monitored at 119-075-01, Stockton SSS8, Manteca Wells 15, 16, and 17, and at Flag City Wells 1, 2, and 3. Chloride concentrations were not monitored at Stockton 10R. Stockton 26 was decommissioned during the previous reporting period and will be replaced by another well within the City of Stockton. In the interim, two additional nearby wells were monitored for chloride during WY 2023: Stockton 27 and Stockton 31. The results from these wells are shown in **Table 9**. Both of the temporary Stockton monitoring wells have chloride concentrations below the minimum threshold established for monitoring location Stockton 10R.

All representative monitoring wells that were sampled in WY 2023 are significantly below both their minimum thresholds and measurable objectives. Interim milestones, which are based on the measurable objective, are not included in **Table 9** as these will be further developed through ongoing water quality monitoring.

Wall	Measurable Objective	Minimum Threshold	WY 2023, if a	available**
Well ID	(Chloride, mg/L)	(Chloride, mg/L)	Date of Measurement	(Chloride, mg/L)
Well 1	500	2,000	11/08/2023	35
Well 2	500	2,000	11/08/2023	73
Well 3	500	2,000	11/08/2023	42
Stockton 10R	500	2,000	**	**
Stockton 26	500	2,000	Well Inactive	Well Inactive
Stockton 27 ¹¹	NA	NA	1/10/2023	26
Stockton 31 ¹²	NA	NA	1/10/2023 8/16/2023	51 27
Stockton SSS8	500	2,000	12/13/2022	36
Well 15	500	2,000	8/12/21	15
Well 16	500	2,000	8/23/22	12
Well 17	500	2,000	5/11/21	17
119-075-01	500	2,000	11/9/2022	27

Table 9. Saltwater Migration Threshold Analysis

**For wells where Water Year 2023 data are unavailable, the current conditions presented in the GSP represent the most recent available information, unless noted otherwise.

¹¹ Proposed replacement option for Stockton 26 in the GSP.

¹² Proposed replacement option for Stockton 26 in the GSP.

4.1.5 Land Subsidence

The GSP uses groundwater level minimum thresholds, measurable objectives, and interim milestones as a proxy for the land subsidence sustainability indicator. An analysis to determine conditions relative to established thresholds (including interim milestones for 2025, measurable objectives, and minimum thresholds) during WY 2023 for the chronic lowering of groundwater levels sustainability indicator is described in Section 3.2. Additionally, per publicly available datasets, there are three Continuous GPS subsidence monitoring stations in the Subbasin, P273, CNDR and P309 that were measured during WY 2023 along with InSAR data released by DWR. P309 and P273 showed no land subsidence over WY 2023. CNDR showed 0.01 feet of land subsidence (within the realm of error) over the last water year. These results are reflected in the recently released InSAR data which show that no land subsidence occurred in the Eastern San Joaquin Subbasin greater than 0.2 feet.

4.1.6 Groundwater-Surface Water Interaction

The GSP uses groundwater level minimum thresholds, measurable objectives, and interim milestones as a proxy for the depletions of interconnected surface water sustainability indicator. An analysis to determine conditions relative to established thresholds (including interim milestones for 2025, measurable objectives, and minimum thresholds) during WY 2023 for the chronic lowering of groundwater levels sustainability indicator is described in Section 3.2.

4.2 PROJECTS AND MANAGEMENT ACTIONS

Progress on each of the projects and management actions identified in the 2020 GSP and the 2022 Revised GSP is included in Appendix A. Details regarding what types of projects and management actions the basin has taken steps to implement, as well as how these have been incorporated into ESJWRM, are included in Section 2.2.7.

Following delays during WY 2020 and 2021 as a result of COVID-19, more progress was made on project development in WY 2023. The City of Stockton Advanced Metering Infrastructure project has approved a contract to begin installation starting January 2024, to be completed over the next 6 years. The South System Groundwater Banking project with East Bay Municipal Utilities District (EBMUD) began its pilot banking project in February 2024 and plans for an expanded, larger scale banking project are underway. The NSJWCD North System Modernization/Lakso Recharge project has constructed Phase 1A, in operation at two locations, and Phase 1B is currently under construction. The Tecklenburg Recharge Project is substantially complete, began operation in July 2023, and is currently working on a new lateral to increase project capacity. A comprehensive Water Master Plan was completed and adopted in December 2022 by SSJID to evaluate aging infrastructure and make improvements to the irrigation system and since they've been implementing the plan by gathering project funding. City of Manteca adopted a Reclaimed Water Facilities Master Plan in January 2023 for their Manteca Golf Course project, has already installed a 12-in pipeline, and is now working to identify funding to finance the construction of the remaining components of the project.

4.3 PROGRESS MADE ON ADDRESSING RECOMMENDED CORRECTIVE ACTIONS

Recommended Corrective Actions were provided by DWR in their July 6, 2023 Approved Determination of the Revised Groundwater Sustainability Plan Submitted for the San Joaquin Valley – Eastern San Joaquin Subbasin. DWR's Determination Letter included eight (8) Recommended Corrective Actions; these are summarized as follows:

- Corrective Action 1 Justify GWL MT and Undesirable Results
- Corrective Action 2 Subsidence SMC justification using direct subsidence monitoring data
- Corrective Action 3 Updated Water Budgets using Recalibrated Model
- Corrective Action 4 Revised estimate for reduction of groundwater storage volume undesirable definition
- Corrective Action 5 Additional justification for 2,000 mg/L chloride isocontour line
- Corrective Action 6 Revised ISW SMC, monitoring network and metrics
- Corrective Action 7 Improved RMN for GWQ
- Corrective Action 8 Development of chloride isocontour line in western portion
 of Subbasin

Some of these corrective actions (such as Corrective Actions 1 and 5) will require additional analyses or documentation to justify or defend the analyses, results or parameters contained in the 2022 ESJ GSP. Other corrective actions (such as Corrective Action 2, 6 and 7) will require revisions to the GSP, including some of the SMC and representative monitoring networks (RMNs). Finally, other corrective actions (such as Corrective Action 8) will require new analyses, which will ultimately be included in the Amended ESJ GSP.

Responses to the Corrective Actions are currently under preparation at the time of this annual report. The 5-year Periodic Evaluation and an Amended ESJ GSP will be completed by the end of 2024 and will include additional appendices and revisions to the GSP to address the recommended corrective actions. In next year's annual report, the finalized approach for addressing each Corrective Action will be summarized.

4.4 PUBLIC OUTREACH

Beyond what is required to implement projects and management actions at the GSA level and in coordination with the 2022 revisions to the ESJ GSP, the following list documents outreach activities completed by the GSAs in WY 2023:

- All GSAs: Six Eastern San Joaquin GWA Board Meetings were held. Seven Steering Committee Meetings were held.
- Eastside GSA: Provided GSP and SGMA updates at quarterly Water Advisory Committee Meetings (October 26, 2022; February 22, 2023; May 31, 2023). Continued to update Stanislaus County Groundwater Division website regarding SGMA information and GSP implementation progress.
- LCSD: Provided updates at monthly Board of Directors meetings on SGMA. Continued to update LCSD website with SGMA information and GSP implementation progress.
- Manteca: Updates were provided on the City's website with prompts to take the ESJ GWA survey. Various social media posts were also developed to promote the survey.
- NSJWCD: Conducted two guided tours of facilities to describe physical conditions and recharge projects/plans/challenges for community members. Prepared three newsletters with SGMA and groundwater related articles mailed to all parcels greater than 5 acres. Held 12 regular public board meetings with a GSP/SGMA update at each. Held two Annual Landowner Workshops at the Grape Festival (one morning and one evening), with associated post card mailers to all landowners in district, to provide SGMA, GSP and district progress updates. Launched new website with user friendly interface regarding SGMA and GSP projects being implemented by the district (www.nsjwcd.com). Outreached to parcel owners greater than 5 acres regarding groundwater charges to fund SGMA related activities, and personal communications with over 300 landowners regarding groundwater charges. Held two targeted workshops and two targeted mailings to landowners along the North System to engage regarding groundwater monitoring and opportunities to expand in-lieu and direct recharge on the North System. Completed direct outreach to the Sierra Club, Self Help and Catholic Charities to discuss domestic well failure experience in our area and ideas for a well mitigation policy.
- OID: Provided updates at their March 7, 2023 Board Meeting on well production, water level data, as well as an update on SGMA and the status of the GSP.
- San Joaquin County: Posted updates, agendas, and minutes for each ESJ GWA meeting.
- SEWD: Presented to the Linden-Peters Chamber of Commerce related to SGMA and protection of SEWD's New Hogan surface water supply. Conducted four directed grower outreach meetings to promote SEWD's in-lieu recharge GSP project. Prepared two newsletters to all of SEWD's constituents, each containing an article related to SEWD.
- SSJID: Held SSJGSA Board Meetings on October 19, 2022, February 15, 2023, and June 21, 2023. Hosted two Grower Advisory Meetings on October 5, 2023 and November 9, 2023 to discuss SSJID's proposed 30-year Water Master Plan. Hosted three informational meetings to provide information on a proposed rate increase for agricultural customers on June 26, 2023 and two on July 13, 2023. SSJID Board of Directors held a public hearing

on July 25, 2023 prior to approving the proposed rate increase which is now in effect for the 2024 irrigation season. Published a Fall 2022 and a Spring 2023 customer newsletter. Hosted an SSJID Community Leaders Tour on September 14, 2023.

As part of the 2022 ESJ GSP revision process to address DWR's January 2022 Incomplete Determination letter, regular public meetings were held with the Subbasin's Technical Advisory Committee, Steering Committee and the Eastern San Joaquin Groundwater Authority Board meetings.

Preparation of the 2025 Periodic Evaluation and resultant Amended ESJ GSP will include an important stakeholder component to ensure public engagement with the GSP process. This work will be funded under DWR's Facilitation Support Services (FSS) and will include four public workshops with interested parties invited to attend to provide feedback on the development of the Amended GSP. The participant list for a stakeholder engagement group was yet to be determined at the time of this annual report. A summary of this process, including any feedback or comments received, will be provided in future annual reports.

Appendix A – GSP Implementation Progress

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 1: Lake Grupe In-lieu Recharge	х	In-lieu Recharge	SEWD	Complete	2020-2023	Project is complete. Meter is installed.
Project 2: SEWD Surface Water Implementation Expansion	x	In-lieu Recharge	SEWD	Implementation phase	2019-2029	The expansion is being implemented in stages. SEWD has completed the conversion of 2505 acres to surface water and is in the planning phase to convert an additional 1135 acres. During WY 2024, the SEWD plans to continue constituent outreach efforts and address the necessary improvements to facilitate the conversions, including providing funding of up to \$200,000 per farm through the CDFA SWEEP BLOCK Pilot Program.
Project 3: City of Manteca Advanced Metering Infrastructure		Conservation	City of Manteca	Experiencing delays due to other higher priority projects needed	TBD	The Project status information presented in the GSP is up to date. Project implementation will take place once funding is available.

Table A-1. Summary of Implementation Progress of GSP Projects and Management Actions

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 4: City of Lodi Surface Water Facility Expansion & Delivery Pipeline		In-lieu Recharge	City of Lodi	Planning phase	2030-2033	The Project status information presented in the GSP is up to date. Project implementation did not occur during WY 2023 since implementation is not planned until 2030. Updates regarding activity progress will be included in future Annual Reports.
Project 5: White Slough Water Pollution Control Facility Expansion	х	Recycling/	City of Lodi	Construction completed	2019-2020	The Project status information presented in the GSP is up to date. The Project is complete.
Project 6: CSJWCD Capital Improvement Program	x	In-lieu Recharge	CSJWCD	Can be implemented immediately	with 7-year completion cycles	The Project status information presented in the GSP is up to date. The Project has been implemented and is on-going each year of available water delivery. This continues to be the case as new customers and locations are added. Updates regarding activity progress will be included in future Annual Reports.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 7: NSJWCD South System Modernization	x	In-lieu Recharge	NSJWCD	Environmental review complete, funding secured for Phases 1, 2 and 3. Landowner improvement district formed. Phases 1-2 complete.	2018-2024	This Project is progressing. Phase 1 completed in 2019-2021 included: new pump station, variable frequency drive (VFD), meters, automation equipment, SCADA, new main junction box at Tretheway and Brandt Road. Phase 2 completed 2023-early 2024 including new sections of main pipeline and adding meters and SCADA. ID3A formed in 2021 for construction of the Pixley lateral, which was completed in 2022. Working on formation of ID3B for Handel lateral (for which NSJWCD received \$1 mil federal grant). NSJWCD was just awarded a \$3M IRWM grant for Phase 3 South System improvements to focus on more mainline replacement and groundwater recharge capacity. Phase 3 will be constructed 24-25. NSJWCD applied for a \$5 mil Watersmart Grant for Phase 4.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 8: Long-term Water Transfer to SEWD	x	Transfers/	SSJ GSA	Infrastructure is in place. Environmental Review may need to be implemented	2019-2021	In 2023, OID and SJJID approved a 10-year water transfer to SEWD. The water will be delivered through the existing Goodwin Tunnel and the Upper Farmington Canal for final delivery to SEWD's municipal and agricultural customers. OID and SSJID will make available to SEWD up to 10,000 AF in critical years and up to 20,000 AF in non-critical years depending on availability of pre- 1914 Stanislaus River water. The water transfer was approved following adoption of a negative declaration per CEQA. Due to extremely wet conditions, no water was transferred in 2023 as part of the 10-year water transfer. In a separate approval in 2023, OID and SSJID did complete a transfer to SEWD for 1,200 AF to serve lands dependent on groundwater, but outside of SEWD's designated CVP service area. The Districts filed a Notice of Exemption for the water transfer.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 9: BNSF Railway Company Intermodal Facility Recharge Pond		Direct Recharge	CSJWCD	Planning phase	2020-2023	The Project status information presented in the GSP is up to date. Project implementation did not occur during WY 2021 due to delays as a result of the COVID-19 pandemic. The project was again delayed in WY 2022 due to severe drought conditions. CSJWCD plans to move forward with the Project during WY 2023/2024 subject to funding. Updates regarding activity progress will be included in future Annual Reports.
Project 10: City of Stockton Advanced Metering Infrastructure		Conservation	City of Stockton	RFP for full AMI ready issued in March 2023. contract awarded and council approval in Jan 2024.	2023-2029	Project will convert touch read meters to full AMI. Planned to be completed over 6 years with a \$17M budget.
Project 11: South System Groundwater Banking with East Bay Municipal Utilities District (EBMUD)	x	In-lieu Recharge	NSJWCD	Pilot Dream Project will be complete by February 2024. Working on expanded banking project	2020-2025	NSJWCD and EBMUD completed contracts, new facilities, water right change petitions, water delivery and extraction for the pilot DREAM Project (1,000 AF). Planning efforts for a larger scale banking project are underway.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 12: NSJWCD North System Modernization/Lak so Recharge	x	In-Lieu Recharge/	NSJWCD	Planning, permitting, environmental complete for Phase 1. Constructed Phase 1A, in progress on Phase 1B.	2021-2026	Project is advancing. NSJWCD awarded Proposition 68 Round 2 funding \$3.9 mil. Phase 1A constructed and operated in 2023-24 to recharge in two locations. Phase 1B under construction to add irrigation deliveries. NSJWCD working with North System landowners to form improvement district to use surface water for irrigation and conduct on-farm recharge in wet years.
Project 13: Manaserro Recharge Project		Direct Recharge	NSJWCD	Planning phase	2023-2025	The Project status information presented in the GSP is up to date. NSJWCD is continuing to work on a strategic plan and funding options for the implementation of this Project and negotiate with landowner or find alternative location. Recently adopted NSJWCD groundwater charge may provide funding to advance this project in future years.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 14: Tecklenburg Recharge Project	x	Direct Recharge	NSJWCD	Substantially complete.	2022-2024	District acquired 10 acre parcel in 2023 and constructed and operated recharge basin from July 2023 to present. District working on new lateral from South System mainline to increase project capacity.
Project 15: City of Escalon Wastewater Reuse		Recycling/In-lieu Recharge/Transfer s	SSJ GSA	Planning phase	2020-2028	The Project status information presented in the GSP is up to date. The Project is in the early conceptual stages and requires additional feasibility analysis and long-term planning. The City of Escalon has hired a consultant to explore the feasibility of project alternatives and to develop engineering plans and specifications.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 16: City of Ripon Surface Water Supply		In-lieu Recharge	SSJ GSA	Design complete; environmental permitting underway	2020-2024	The City of Ripon is set to receive \$3.5 Million in directed congressional funding through the State Drinking Water Revolving Fund. The City of Ripon is seeking terms to connect to the Nick DeGroot Water Treatment Plant from the current South County Water Supply Program participants and will also need to work through SSJID design criteria for connection to its drinking water facilities.
Project 17: City of Escalon Connection to Nick DeGroot Water Treatment Plant		In-lieu Recharge	SSJ GSA	Conceptual design phase; environmental review complete	2020-2023	The City of Escalon completed an initial feasibility study of alternatives currently range between \$3.5 million - \$8 million. In 2023, the City of Escalon is further developing its engineering design to incorporate design criteria for connection to SSJID drinking water facilities and right- of-way acquisition needs. Escalon is nearing the 35% design milestone.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 18: Farmington Dam Repurpose Project		Direct Recharge	SEWD	Preplanning phase with reconnaissance study complete	2030-2050	The Project status information presented in the GSP is up to date. Project implementation did not occur during WY 2022 as SEWD dedicated resources to bring short-term projects online first. SEWD has been working with Congressman Harder to include this project within the 2024 Water Resources Development Act (WRDA) bill to re-authorize a new feasibility study. More resources will be directed toward the feasibility study, expected to begin in 2024. Updates regarding activity progress will be included in future Annual Reports.
Project 19: Recycled Water Transfer to Agriculture		Recycling/Transfer s/In-lieu Recharge	City of Manteca	Planning phase with evaluation completed in Reclaimed Water Facilities Master Plan	Not determined	The Project status information presented in the GSP is up to date. Project implementation will take place once funding is available.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 20: Mobilizing Recharge Opportunities		Direct Recharge	San Joaquin County	Early conceptual planning phase	Not determined	The Project has been expanded into a multi-benefit project, and the ESJGWA will apply for grant funds for the expanded project under the Sustainable Groundwater Management Implementation Grant Program Round 1. Regionwide surface water availability and needs are being discussed, and future acquisition of the Mokelumne River Water and Power Authority's water rights will be explored. Updates regarding activity progress will be included in future Annual Reports.
Project 21: NSJWCD Winery Recycled Water		Recycling/In-Lieu Recharge/Direct Recharge	NSJWCD	Conceptual planning and discussion	2025-2027	The Project status information presented in the GSP is up to date. NSJWCD is continuing to work on a strategic plan and funding options for the implementation of this Project or a similar project with winery.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 22: Pressurization of SSJID Facilities		Conservation	SSJ GSA	Feasibility study complete	2019-2030	In WY 2021, SSJID evaluated the feasibility of converting its entire irrigation system to a pressurized piped system which proved to be infeasible due to costs. Instead, SSJID embarked on a comprehensive Water Master Plan to address its aging infrastructure and to make strategic improvements to SSJID irrigation system. SSJID hopes to improve the level of service to customers through increased lateral capacity, new reservoirs, and additional SCADA controls. The SSJID Board of Directors adopted the WMP in December of 2022. In total, SSJID has identified \$191 Million in capital improvements and to fund these projects, SSJID completed a substantial Prop 218 rate increase in July 2023.
Project 23: SSJID Storm Water Reuse		Storm Water/In- lieu Recharge/Direct Recharge	SSJ GSA	Planning phase	2027-2030	The Project status information presented in the GSP is up to date. Project 23 remains a project concept that could be considered for as WMP projects are advanced, and the concept integrated during the engineering design process.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Project 24: South Stockton Well Rehabilitation Program (new)		Monitoring and Reporting	City of Stockton	Rehab existing wells. Design in progress to add well head treatment to existing Well SSS8. Back-up power to be added to Well SSS3 & SSS9.	2021-2024	Design of SSS8 well head treatment is complete and construction to be complete in Feb 2024. HCS Engineering to design backup power to Well SSS3 and SSS9. The design is scheduled to be complete in early 2024.
Project 25: Delta Water Supply Project Phase 2: Groundwater Improvement Project	x	Direct Recharge	City of Stockton	RFP advertised in Jan 2022 for geotechnical investigation and feasibility study. Recharge basin will be designed and constructed.	2022-2026	The request for proposals was released in early spring of 2022. Geosyntec was awarded the contract, and the geotechnical study began in July of 2022. The geotechnical and feasibility study are scheduled to be completed in early spring of 2023. Geotechnical study is complete the design and construction of the basin(s) will begin.
Mokelumne River Loss Study		Model Refinement and Validation	NSJWCD	Conceptual planning and discussion	2020-2025	The Project status information presented in the GSP is up to date. Project implementation did not occur during WY 2021 due to a lack of funding and lack of staff resources to complete the plans and move the projects forward. NSJWCD is continuing to work on strategic plan and funding options for the implementation of this Project.

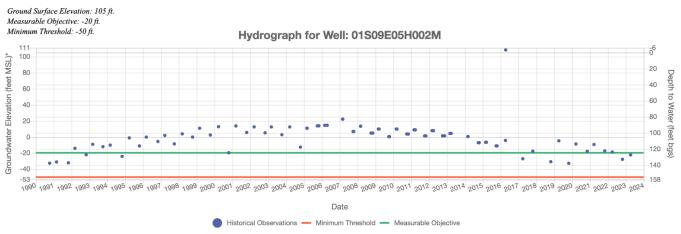

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Monitoring and recording of groundwater levels and groundwater quality data		Monitoring and Reporting	Implemented at Subbasin scale	Ongoing	2020-2040	The Project status information presented in the GSP is up to date. This is the fifth Annual Report that reports groundwater level and groundwater quality monitoring data. Updates regarding activity progress will be included in future Annual Reports.
Maintaining and updating the Subbasin Data Management System (DMS) with newly collected data		Monitoring and Reporting	Implemented at Subbasin scale	Ongoing	2020-2040	The Project status information presented in the GSP is up to date. The DMS was maintained and updated to include monitoring data for WY 2023. Updates regarding activity progress will be included in future Annual Reports.
Annual monitoring of progress toward sustainability		Monitoring and Reporting	Implemented at Subbasin scale	Ongoing	2020-2040	The Project status information presented in the GSP is up to date. This is the fifth Annual Report that monitors the progress toward sustainability. Updates regarding progress toward sustainability will be included in future Annual Reports.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
Annual reporting of Subbasin conditions to DWR as required by SGMA		Monitoring and Reporting	Implemented at Subbasin scale	Ongoing	2020-2040	The Project status information presented in the GSP is up to date. This is the fifth Annual Report that describes the current conditions in the Subbasin and will be submitted to DWR as required by SGMA. Updates regarding Subbasin conditions will be included in future Annual Reports.
Addressing Data Gaps		Monitoring and Reporting	San Joaquin County	Ongoing	2020-2040	During WY 2021, NSJWCD contracted with DWR and San Joaquin County to install a TSS monitoring well with in the NSJWCD area.
Wallace-Burson Conjunctive Use Program		Conjunctive Use/Direct Recharge	CCWD	Conceptual planning and discussion	2030-2040	Hydrogeology and water supply studies developed; designing and developing specific program facilities (e.g., recharge basins, conveyance).
Calaveras River Wholesale Water Service Expansion		In-Lieu Recharge	CCWD	Conceptual planning	2020-2040	CCWD has available surface water supply to set up agreement(s) facilitating in-lieu recharge in Calaveras County portion of subbasin. Studies needed based on specific partners, arrangements, etc.

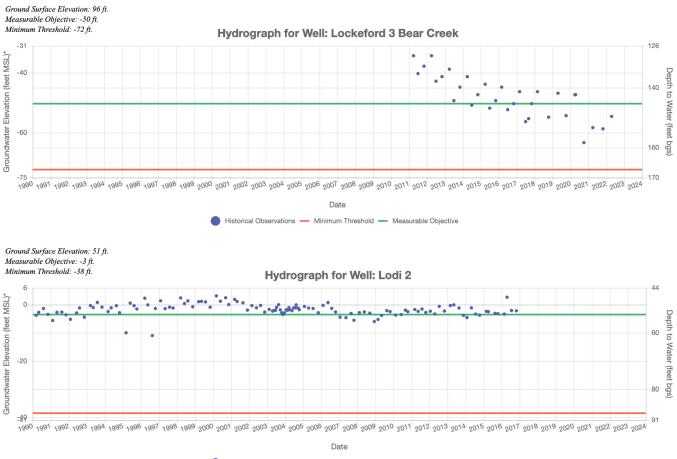

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
AMI Replacement and Conversion		Monitoring and Reporting/Conserv ation	CCWD	Complete	2022	CCWD completed replacement and conversion of customer water meters to Automated Meter Infrastructure (AMI) in March 2022. Anticipated improved customer-level consumption data going forward.
Groundwater Monitoring Plan		Monitoring and Reporting	NSJWCD	Ongoing	2023	NSJWCD retained a hydrogeologist, installed one monitoring well in 2023, and is contracted in stall 3 more monitoring wells in 2024. District also began collecting water level data from ag wells in 2023 to inform a larger scale monitoring program.
Recycled Water to Manteca Golf Course		Recycling	City of Manteca	12-in pipeline installed. Waiting for DWR to determine grant recipients.	Not yet determined	The Reclaimed Water Facilities Master Plan was adopted in January 2023. The city is pursuing recycled water projects, one of which is sending reclaimed water to irrigate the Manteca Golf Course. 12-in piping to deliver reclaimed water has been installed. The city is pursuing funding, like grants, to finance the construction of a pump station, and storage tank(s) to transmit water to the golf course.

Activity	Category A Project	Project Type	Project Proponent	Current Status	Schedule (initiation and completion)	Status
West Groundwater Recharge Basin	x	Direct Recharge	SEWD	Ongoing	2032	The project is currently in the design stage with first phase construction beginning spring 2024 and is estimated to be completed in approximately 2032.
Threfall Ranch Reservoir, In-Lieu and Direct Recharge Project		In-Lieu and Direct Recharge	Stanislaus County SMWC	Ongoing	2025	Final design has been completed, and environmental review and permitting is pending receipt of project funding.

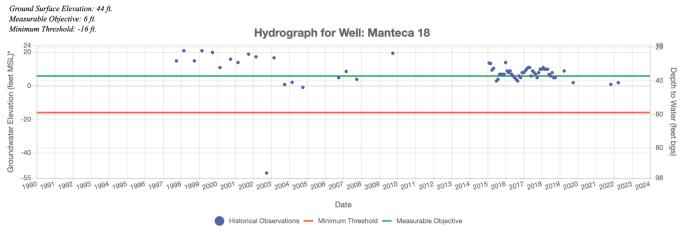

APPENDIX B – REPRESENTATIVE MONITORING NETWORK WELL HYDROGRAPHS

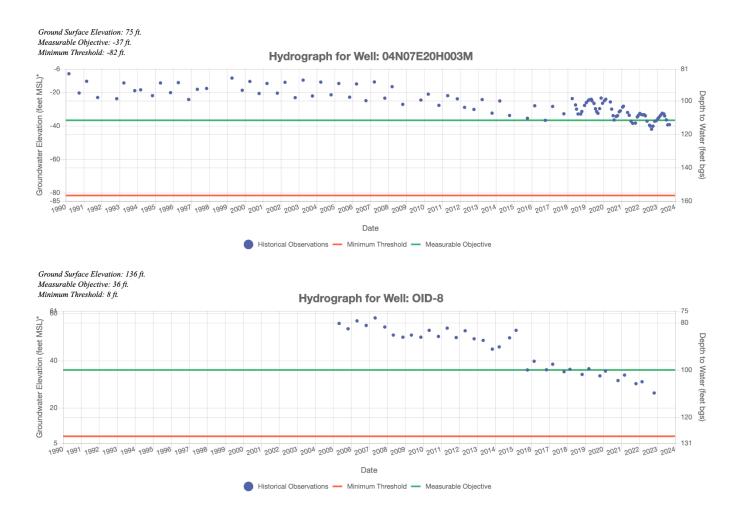

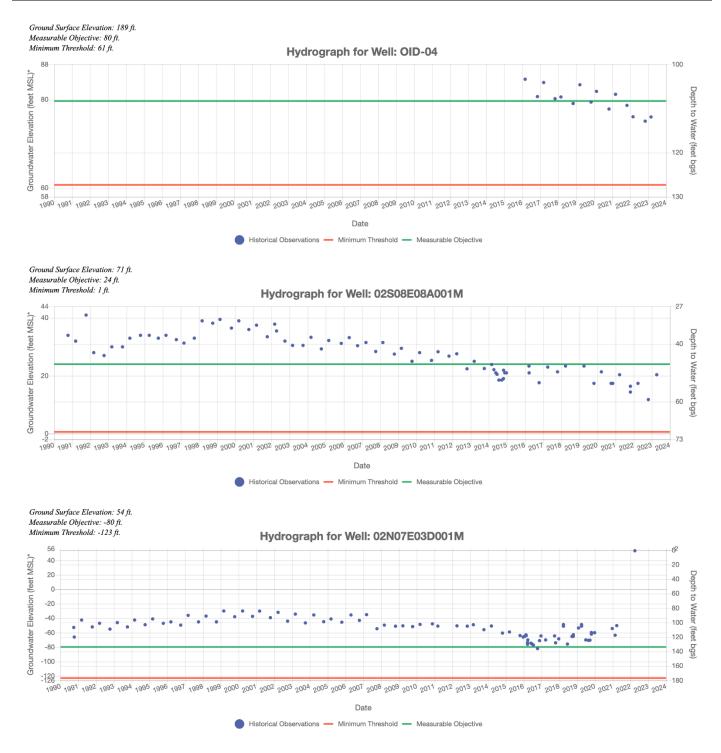

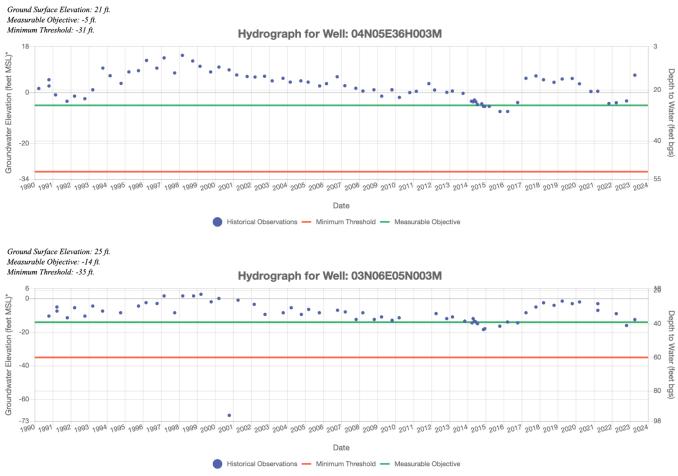

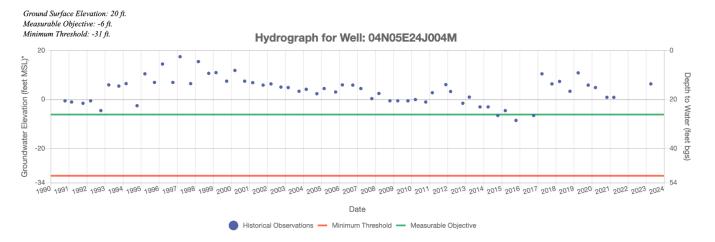

The dataset shown in the above hydrograph has been revised to remove the 2002 outlier.

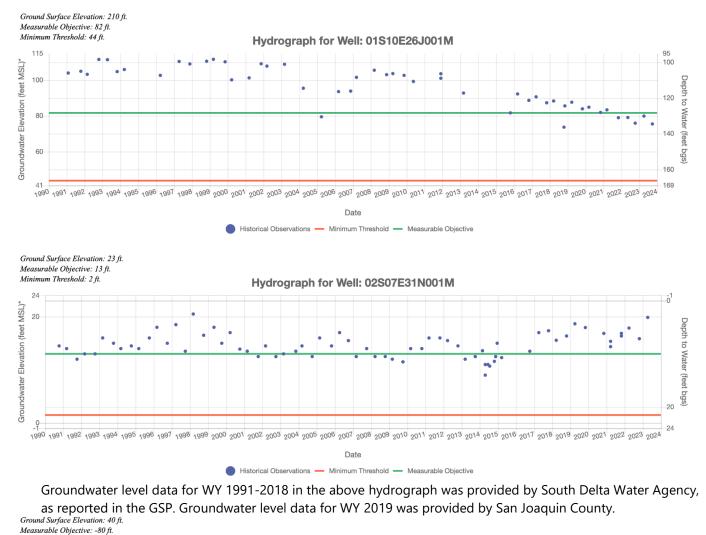

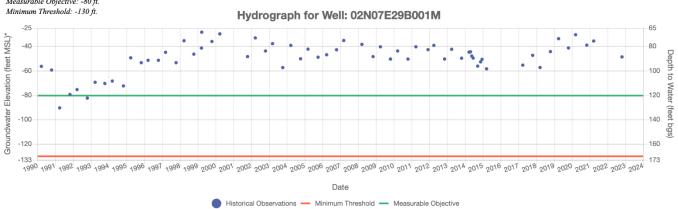

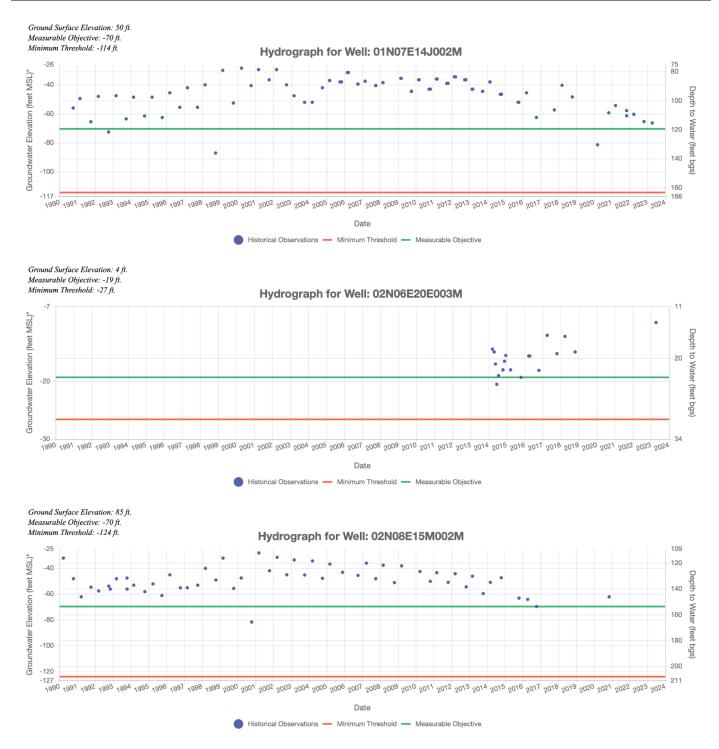

The dataset shown in the above hydrograph has been revised to remove the 2000 outlier.

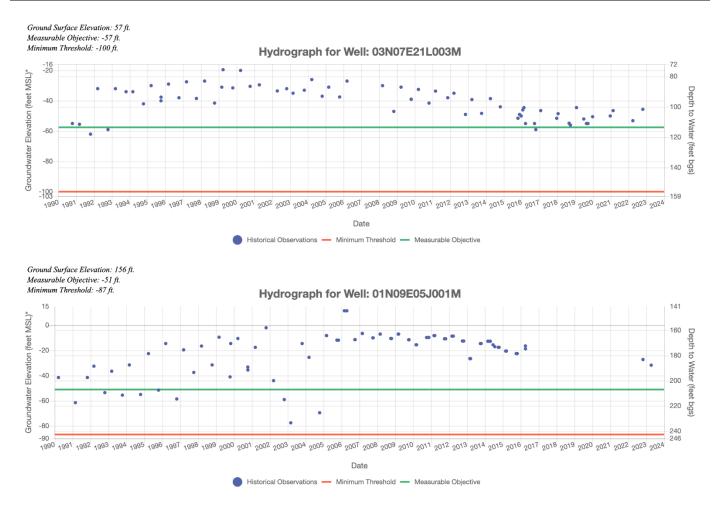

Groundwater level data for WY 1991-2018 in the above hydrograph was provided by Stockton East Water District, as reported in the GSP. Groundwater level data for WY 2019-2020 was provided by San Joaquin County.

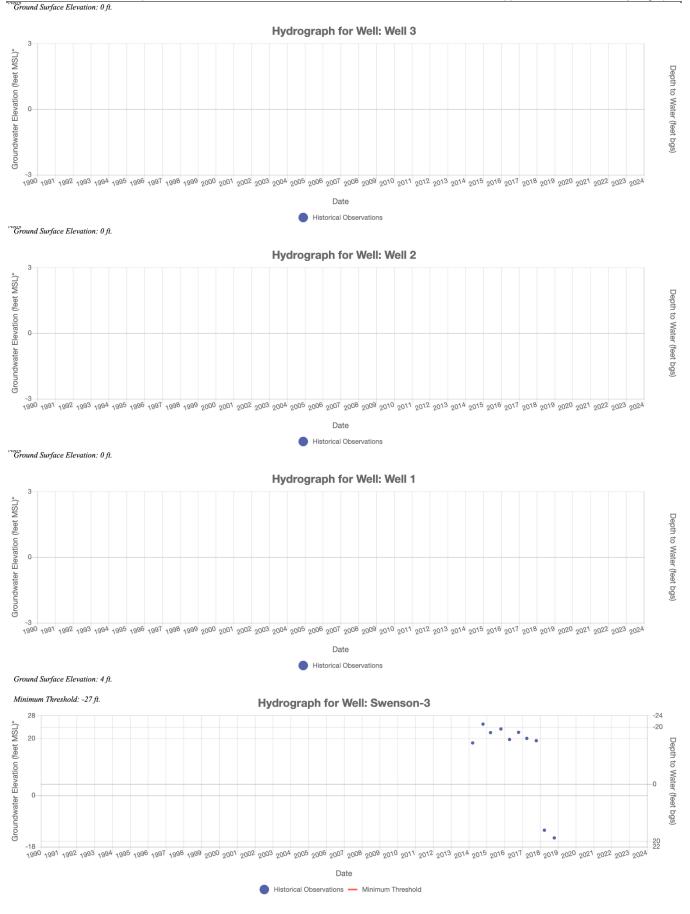

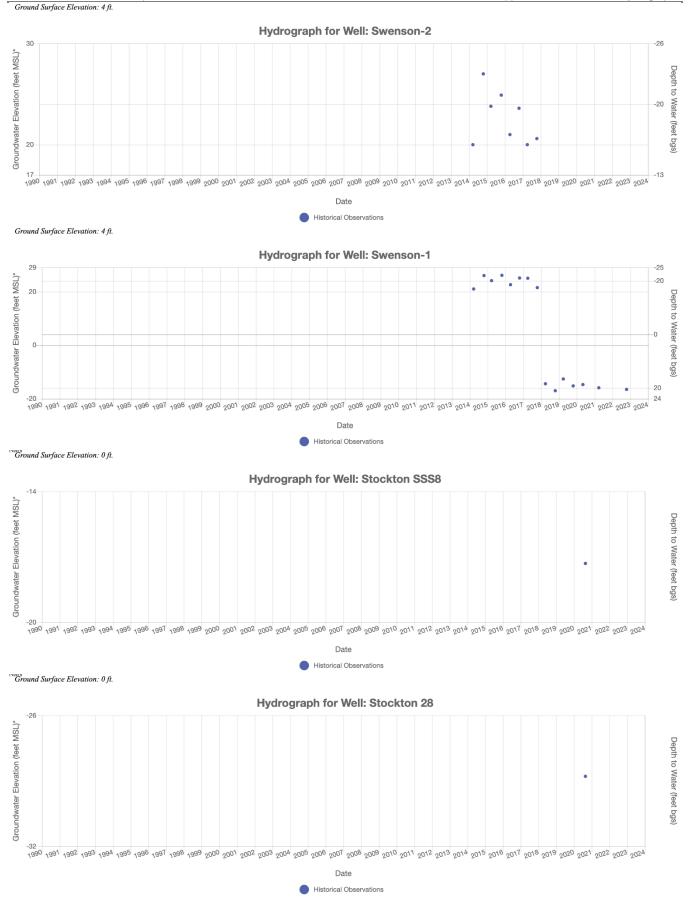

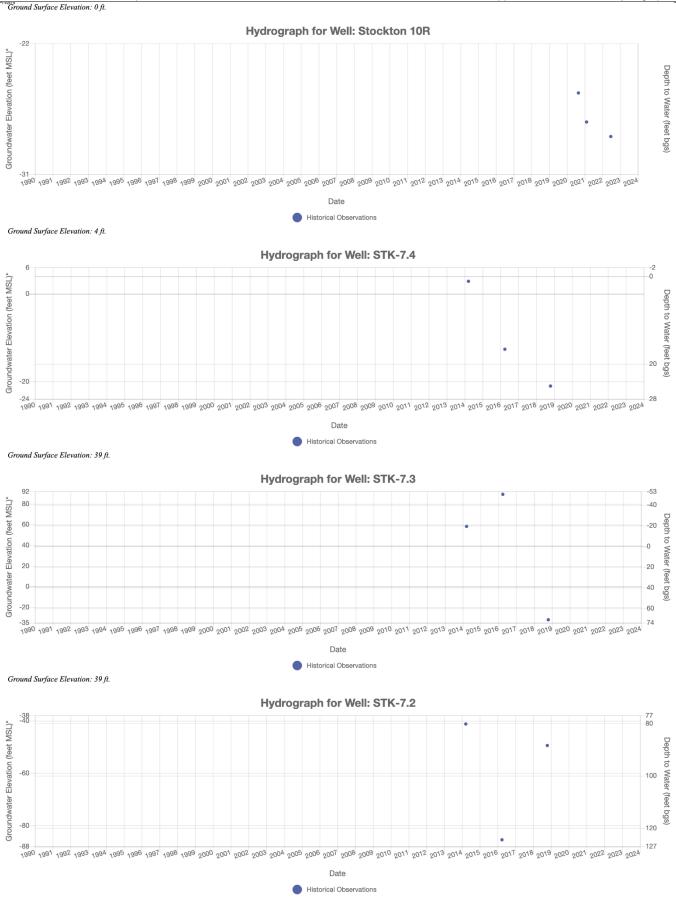

This page left blank intentionally.

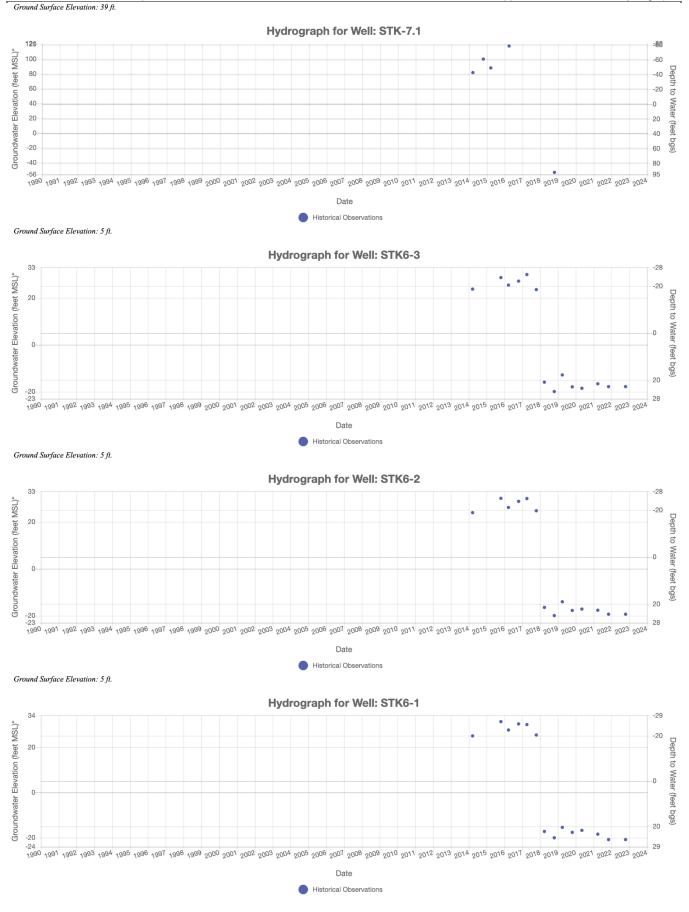

APPENDIX C – BROAD MONITORING NETWORK WELL HYDROGRAPHS

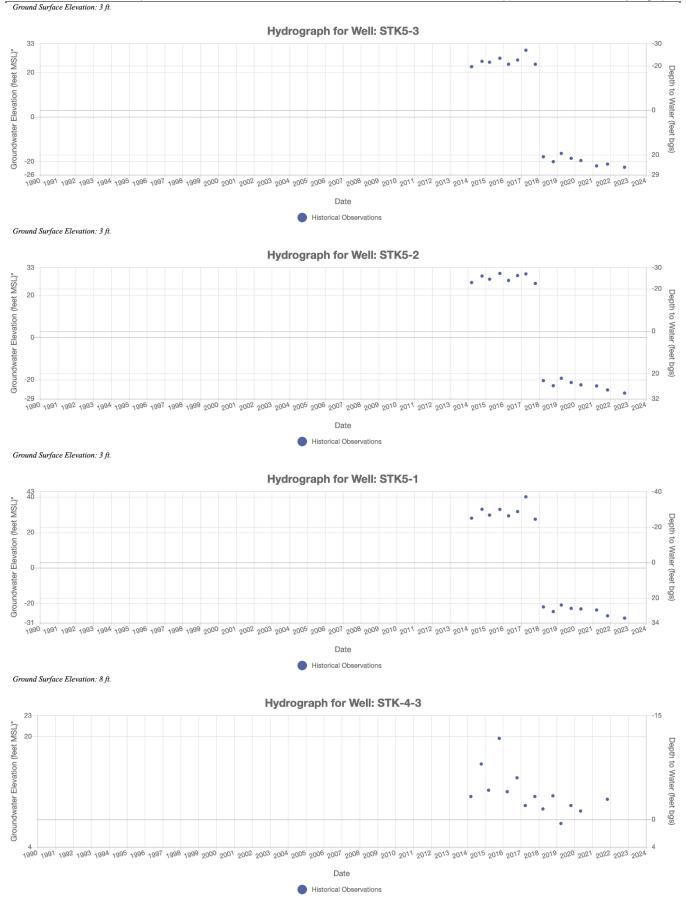

Note: Included in Appendix C are the 76 broad network CASGEM well historical hydrographs and 52 broad network nested well historical hydrographs listed in Appendix 4-A of the GSP. Wells for which historical data are not available are included as hydrographs with no data points. Future annual reports will report on the monitoring carried out at these wells, along with those in the representative monitoring network, as the GSP is implemented. Additionally, 15 local wells that have historically been monitored for water quality will also be monitored for water levels as the GSP is further implemented. These data will also be reported on in future annual reports.
